morial Hospital for Trachoma, which is being so well conducted in Richmond It is noteworthy that this beautiful building and mainds were given to the Kentucky State Medical Association by Mrs Elizabeth Irvine, as a memorial to Ephraim McDowell, the immortal 'Father of Ovariotomy' The State Association has loaned it to the State Board of Health, which is jointly financing the conduct of the hospital with the United States Public Health Service, the latter providing one of its accomplished surgeons as the officer in charge of the institution. It is hoped that every physician in attendance will inspect this splendid institution, and will see Doctor Sory's demonstration of the methods used in the diagnosis and treatment of this disease"

County Departments of Health—After discussing the establishment of four new county departments of health the Council says

"These departments are educating our people so that they will be increasingly dependent upon those physicians who are developing themselves as human engineers, able in their offices to detect the slighter deviations from the normal, and the tendencies toward conditions that will, if left untreated, bring about diseases that will incapacitate or kill. In the past, the major problem of the practitioner

of medicine was to prevent death from acute or chronic illness. In the future it is going to be to prevent the development of disease, or to remove causes and defects that might produce it far earlier. The people are rapidly realizing this. It is far more essential that the profession do so."

The report ends with a brief discussion of the Women's Auxiliary and a post graduate course in the Louisville City Hospital.

TEMPLE UNIVERSITY

The Atlantic Medical Journal for July contains the following item

"The Council on Medical Education and Hospitals of the American Medical Association has announced that the rating of the school of Medicine of Temple University, Philadelphia, has been raised to Class A. This endorsement of its standing should be especially gratifying to its many friends"

It may be added that the endorsement is also gratifying to the physicians of New York State, for Dr Frank C Hammond, the Editor of the Atlantic Medical Journal, is Dean of the Temple Medical School, and Dr E. C. Morgan, professor of therapeutics, is President of the Medical Society of the State of Pennsylvania

REPAIR OF HERNIA WITH FASCIAL SUTURES

CARL GOODWIN BURDICK, MD, NEW YORK, NY

THE repair of hernia with fascia has been advocated by various surgeons or the past twenty-five years. McArthur about that time utilized a strip of the inner leaf of the external oblique, the length of the strip being limited above by the muscular belly leaving it attached at its lower extremity. Free patch transplants of fascia lata sutured into the muscular defect in large inguinal and ventral hernias has been advocated by Kirschner, Neuhof and others.

Gallie and Le Mesurier reported in 1923 their experiments with fascial sutures and the results in nearly one hundred operative cases Briefly their conclusions are as follows uring of fascia to muscle or fascia to fascia with catgut results in healing by means of delicate scar tissue which develops from the areolar membrane investing the surfaces and from the loose connective tissue stroma separating the bundles of fibers. The scar is not strong and if subjected to strain slowly stretches When linen sutures are used the tendency to stretch is not so marked as the sutures assist in holding the edges together In many cases the linen cuts out and the wound stretches exactly the same as when absorbable sutures are used Overlapping the edges of the wound adds little to the solidity of healing. Scarification of the tissues before suturing increase the density and strength of the scar but prolonged and unusual strain results in its stretching Side to side suture as is done in suturing the conjoined tendon to Poupart's ligament never results in permanent adhesions even under the slightest strain

Free transplants of fascia if placed in such a position that they can receive adequate lymph supply continue to live unchanged but when used to fill anatomical defects heal to the structures to which they are sutured in exactly the same manner as described above and the degree of adhesion is only that which is provided by delicate areolar tissue. To overcome tre element of chance which always

"Read at the Annual Meeting of the Medical Society of the State of New York, at Albany N Y., May 22, 1928. attends dependence on the strength and resistance of scar tissue they experimented with transplants of fascia lata as living sutures which night permanently hold the edges of hernial rings together without depending on the natural process of repair They found that these fascial sutures continued to live practically unchanged and their tensile strength remained unimpaired As a result of passing through a needle hole they became folded into round cords which soon became surrounded with a delicate vascular membrane such as is normally on the surface of fascia and on cross section looked like normal tendon In all their experiments the suture was s ccessful in holding the edges of the gaps in the fascia at the same distance from one another as at the time of operation and it was only necessary to make certain that the suture obtained a solid grip of the edges of the opening to assure the success of the repair

Over two years ago Koontz reported a series of experiments on the use of dead fascia preserved in alcohol in the repair of hernia and last year published his results in seventeen hernia operations The fascia is obtained from beeves and Johnson and Johnson soon hope to have it on the market. Koontz feels that the collagen fibers which make up the bulk of fascial transplants are nearly inert bodies that form a part of the living organism and preservation in alcohol does not alter them. The dead cells, that is the dead protoplasm of the alcohol preserved fascial grafts are removed by the invading cells of the host when the graft is implanted because they are dead extraneous matter but the fibers of the graft are left intact because they have the same physical and chemical character as like fibers of the

Through the courtesy of Doctor Koontz we have used some of his sutures and the results have been satisfactory

We make it a practice to preserve all our excess suture material in Scott's solution composed of Alcohol (95%) 55, Acetone 10, Mercurochrome 2, Aqua dist. 33, and do not hesitate to use it when we wish to do a fascial

This New Needle Cannot Rust

There is a new hypodermic needle. It is made of genuine Firth Stainless Steel It frees you from the annoyance of rust and corrosion It does not have to be wired or even dried after cleansing It is always sharp If you would like to test it we will send you a genuine VIM Stainless Steel needle free of charge

Then you can use it in your own practice In intravenous, intra-muscular and hypodermic work. It is impervious to most acids and reagents, also saline solutions and serums does not clog or corrode Thus it insures you against breakage It has the cutting qualities of high carbon steel, with all the advantages of genuine Stainless Steel in addition (Have you read the monograph, "New Advances in Technique?")

Tear off this ad and send it with your pro-fessional card or letterhead We will send you a monograph Both are free and postpard Write

The fascial sutures are introduced as follows Insert one finger beneath the muscle and fascia at the lower angle to act as a guide and pass the needle of the fascial suture through these structures of the posterior wall, frequently the edge of the rectus being in-

Fig 4
Threading fascial sutures

cluded in this first suture. After anchoring the suture, clear exposure of the insertion of Poupart's ligament into the pubis is obtained by adequate retractors. The needle is inserted down to the periosteum and the suture passes through the ligament at its insertion into the pubis. Too much emphasis cannot be laid on

satisfactory exposure, for without it proper insertion of this most important stitch is impossible. The fascial suture is continuous and second bite is obtained one-half inch above the first, including internal oblique and transversalis muscles and transversalis fascia. The thighs should be flexed to aid approximation if necessary and after the second suture is in-

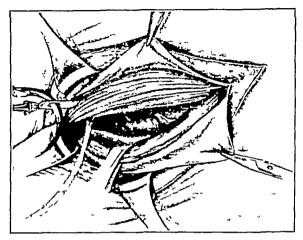

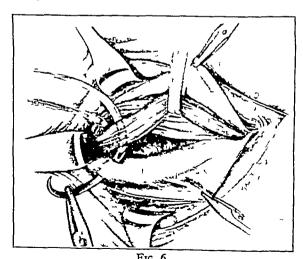

Fig 5
Introduction and fixing first suture

serted into Poupart's ligament one interrupted suture of chromic catgut is passed through all the tissues united including the fascial suture. This step fulfills two purposes—It anchors the fascial suture and helps to hold the structures in approximation until the fascia has become

Passing needle and suture through Poupart's ligament at its insertion

incorporated in the tissues Care must be taken to have the sutures close enough together so that no tabs of properitoneal fat

repair in a case not previously diagnosed as suitable for that type of operation

In the last four years we have done nearly four hundred fascial repairs at the Ruptured and Crippled Hospital and agree with Gallie that the method is indicated in the following conditions

(1) Direct inguinal hernia

(2) Oblique inguinal hernia in patients at or beyond middle life where the canal has lost its obliquity and when the abdomen is becoming pendulous

(3) Femoral hernia in which the suture is used to close the entrance of the femoral ring through the inguinal incision

(4) All forms of recurrent hernia

(5) All ventral hernias including umbilical and epigastric

The sutures are taken from the fascia lata of the thigh, each being a quarter of an inch wide and as long as the particular thigh will allow. These are threaded on a special needle and used as ordinary sutures in doing the plastic repair. The operator having decided upon which side of the patient he will stand, the op-

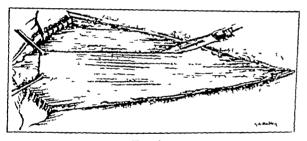

Fig 1
Removing fascia from thigh—start

posite thigh is prepared at the same time as the hernial field While the surgeon is getting the herma ready for the repair, the assistant removes the fascia as follows An incision is made starting at the great trochanter and extending downwards and a little backwards, because the fibers of the fascia lata extend in that direction, to three inches above the knee cision having been carried through the skin subcutaneous tissue to the fascia lata, the former is cleared away from the fascia and an idea as to the number of sutures required is ob-As each suture is tained from the surgeon one-quarter of an inch wide, if four are needed a strip one inch wide is obtained, by first making an incision in the fascia one inch long at right angles to its fibers Two vertical incisions one-half inch long are made at either end of the first incision and the angles thus formed are each grasped with Allis forceps, and it is now a very simple matter to continue the vertical incisions in the direction of the fascial fibers separating the fascia from the underlying muscle as the incisions are extended until a strip of sufficient length is obtained. Care must be taken not to carry the incisions too far posteriorly else one will get into the external intermuscular septum. It is also important never to start removing the fascia from below upwards because as we reach the insertion of the tensor fasciae femoris into the fascia lata we are apt to be led into the wrong plane and find that muscle is attached to our fascial flap. The strip is now ready to cut into sutures. The four corners are grasped with Allis

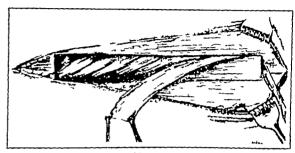

Fig 2
Removing fascia from thigh—finish

forceps and two more applied adjacent to the two on the left side. These are held taut and a strip one-quarter of an inch wide is cut, starting between the two clamps on the left near corner with straight scissors. This is placed in salt solution and a second strip cut by applying two more forceps. Each succeeding one is placed in salt solution until they are all cut. The sutures are now threaded and tied in place with plain catgut, the opposite end also being

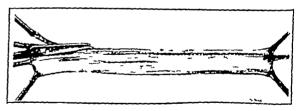

Fig 3
Cutting fascia into strips

ligated to prevent fraying Gallie uses silk Some advocate transfixing to prevent slipping, but it is not essential. The sutures may be left in salt solution or if they show a tendency to swell may be wrapped in gauze wet in salt solution. No attempt is made to close the incision in the fascia lata. Gallie recommends it, but in several hundred operations we have seen no disability resulting, in fact we feel it a decided disadvantage to put so much tension on the fascia.

The operator should now have the hernia ready for the plastic repair while the assistant closes the skin of the thigh

satisfactory Kangaroo tendon has probably had as wide a vogue in use as any but it has the following disadvantages

It may cause sinuses in the wound The sinuses are freely opened or drained by the surgeon I have not seen this result unfavorably but it is an annoying complication For this reason, kangaroo tendon has not been used

The Gallet technique opened up an entirely new field and Kale has followed this up with his work on dead fascial sutures which, if objection to it can be overcome, promises, perhaps, to supersede the living fascial sutures taken from the patient himself to quite an extent.

Ox fascial suture that we have used has not been as satisfactory as the living fascial suture. It is varied in its tensile strength and in its uniformity or size and is very apt to tear. We have relegated it to second place, preferring the living fascial suture.

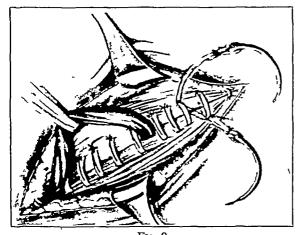

Fig. 9

Second row of sutures completed picking up suture of posterior wall which has transfixed the external oblique

I would like to stress one or two points in the technique Dr Burdick mentioned the importance of exposure. This is important in any hernia operation. It is especially important to get the first suture placed in the peritoneum over the pubic spine and unless proper retraction is made, this will probably be a difficult step. With proper care it becomes an easy step.

It is very important to verify the point where the cord emerges because with the type of operation that we are doing beneath the cord, the obliquity to the inguinal canal is less and the cord emerges in a straight line.

A number of personal failures that I have had with this method can be traced to failure to properly close the region of the emergency of the cord

Anaesthetic We have become very favorably impressed with ethlyn as the choice anaes-

thetic for this type of work. This operation is somewhat prolonged and we find a dimunition in the vomiting and other after effects. I remember at one time I refused to operate on a patient because I did not believe it could be done under a local anaesthetic. I have since done several under local and others have done so and it is feasible to do a living suture operation under local anaesthetic. It takes a little more time and requires care in administering the anaesthetic.

We have also just begun the use of spinal analgesia in isolated cases We see a limited field for it in certain cases. It will probably never be as widely used as the ethlyn anaesthetic for the ordinary case.

In closing, I would like to say that it has been a privilege for me to be associated with Dr Burdick I personally have done 98 fascial suture operations but am not prepared to give you the results today A number of recurrences due to faulty technique in performing the operation have resulted, but on the whole my results have pleased me and I feel the operation is sure to become more widely used. A great many more patients can be operated upon and hernia cured than would be possible with the older method of operation

Dr Barber There are one or two points that the writer of this paper can help us on

1st—Does the operation offer any greater risk to the patient from the standpoint of mortality?

2nd—From the statistics known to date, does it offer a better percentage of good results than obtained by other methods? Facts speak louder than fancy and we would like to know whether there are any definite facts known to make them worthy of comparison with the old figures. I would like the writer of the paper to elaborate on these two points

Dr Warsaw I would like to testify as to the merits of the fascial suture operation. I have not done as many as the writers of the paper have, but in about twelve done, most of them under local anaesthetic, so far no recurrences have resulted. One case which stands out particularly is a man about 35 with a double recurrent inguinal hernia. I was able to repair the three hernias. It is now one year without recurrence and I would like to express my appreciation of the very fine work that Dr Burdick has done and my gratitude for being able to work under him for a year at the Ruptured & Crippled Hospital

Dr Parkis Dr Burdick spoke of one weak stage—bringing the cord through the external oblique. I would like to ask why he says that.

Dr Clinton, Buffalo, N Y At our hospital in Buffalo, we have had opportunity of using this method and after hearing Dr Burdick's

protrude between them The suture is continued up to and around the internal ring anchoring each bite with an interrupted chromic. The upper leaf of the external oblique is now transfixed and the suture left in this position

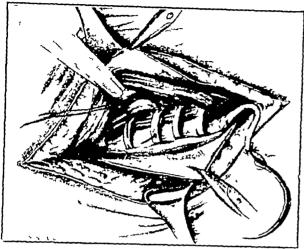

Fig 7

Posterior row of sutures completed Interrupted chronic sutures anchoring each continuous fascial suture

for the moment. A second suture now unites the two layers of the external oblique in a similar manner, care being taken to get a good bite of Poupart's again at its insertion. This structure is sutured as tightly as possible about the cord at the level of the internal ring and the first suture which transfixed the upper leaf is picked up in the closure above the cord and the two united with one or more interrupted chromic sutures.

In ventral and umbilical hernias it is not necessary to overlap the muscle and fascial planes but there is no objection if one prefers. The peritoneum should be closed as a separate layer if possible and muscle and fascial approximated with continuous fascial sutures anchoring every every other one with an interrupted chromic. If the defect is large it is well to weave a second row over the first, getting a good bite of tissue about an inch outside the first row.

Infections We have had perhaps a dozen cases which developed late infections, some about the tenth post-operative day, others after the patient had left the hospital Usually part of the fascial sutures have sloughed and in one case practically all the sutures were extruded and a recurrence developed

Results Personally the author has performed 163 fascial repairs up to January, 1928, in the following groups of cases

Indirect.	•			•	45
Indirect with	direc	t wea	kness		14
Direct	•	-	• •	• •	61

Recurrent Ventral Umbilical Epigastric	•	•		•	29 10 2 2
				-	

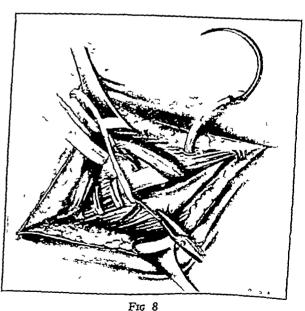

163

While we have not been able to successfully follow all the cases we have observed the following recurrences one double oblique with direct weakness recurred at the end of two years, one direct recurred at the end of one year, in one double recurrent one side recurred at the end of fifteen months, one oblique with direct weakness developed an infection on the tenth day with sloughing of most of his fascial sutures recurred at the end of nine months

We feel that the use of fascial sutures in the radical cases of certain types of hernia is the greatest advance since the Bassini operation When dead ox fascia has been properly prepared and cut we believe it will largely supersede autogenous living sutures, but at the present our preference is decidedly for the latter

DISCUSSION

Dr Coley You have heard Dr Burdick's able presentation of this subject and I will suggest stressing a few points that occurred to me in connection with it.

Suturing external obline behind cord Note first suture has transfixed the upper leaf of external oblique

The subject of suture material for use in hernia operations has been threshed about widely and no one material would meet with universal satisfaction. Silver wire, silk, linen thread, catgut and other materials have been used and none of them have proved entirely

ferentiate between those problems which have their origin in disease, and those which simulate disease but which have their origin in problems of behavior Instances are numerous where an infant or child is brought to the physician for a supposed physical ailment which in reality has its root in the environment or the personality of the child Often the problems relating to fatigue, both in infancy and childhood, so color the actions and reactions of the child as to render them readily mistakable for the signs of true organic disease Therefore the physician must be familiar with the signs, symptoms, diagnosis, prophylaxis, and treatment of fatigue, in order to help himself in the solution of many vexed problems of the early years of the child

It is fitting therefore to discuss a few of the problems of the rearing of children, especially in their relationship to the physician who is interested in the care of children. The opportunities for the physician to exert his influence begin almost with the birth of the child. All the questions of maternal nursing, of wet nursing, and of artificial feeding, are intimately bound up with questions of infant behavior.

Care by the Mother—It is scarcely in order to discuss the relative values of maternal and artificial feeding, but it is directly germane to liscussion to point out the value of maternal nursing from the standpoint of the mother-child relauonship The child is not born with an instine ive attachment to his mother, such an attacmnent, if it is desired, must be developed, and this development is best fostered through maternal nursing, and so far as is possible, personal maternal care of the child for a part of its needs at least The child's greatest attachment is developed for the individual who feeds it and looks to its comfort, therefore, the mother who desires the greatest attachment and devotion from her child must herself see to the feeding and some of the care It follows from this that, even where a baby is fed artificially, some if not all of the feedings must be given by the mother also give her child some of his baths, and in many other ways identify herself with contributing to his comfort. The duty of educating the mother in these matters devolves of course upon the physician

The Nurse — This brings up the vexed question of the place of the nurse in the family. The problem is a difficult one, which is too often handled in too diplomatic a manner. Physicians 'ear offending children's nurses as a class, and parents are in fear of giving offence to the particular nurses in their households. This attitude often leads to a want of complete understanding, which is not in the best interests of the child. The place of the nurse in the household must be one which is clearly understood by all persons concerned from the very outset. The nurse is the assistant to the mother, guided by the physi-

cian The mother must at all times and under all normal circumstances be the one who is in charge of the child, and nothing whatever is to be done to the child without her knowledge and consent. This is a simple and straightforward stand, and should be easy to put into effect from the day that the nurse assumes her duties. The arrangement should not be productive of any difficulties, yet it is through the want of definite and complete understanding between mother and nurse that many difficulties arise. Some of these difficulties often involve the physician, but in the end they reflect themselves in the want of proper rearing of the child, who becomes the innocent sufferer

No woman, in applying for a position as nurse to an infant, has the right to demand, as one of the conditions of her employment the complete charge of the baby There are times when the terms include dispensing with the advice of the physician in matters of feeding, periodic exammations, etc Some nurses will refuse to allow the mother to bathe her own baby, or to see it, except at certain times Under such circumstances, the mother, when she submits calmly to such treatment, becomes a virtual stranger to her own child, and the child, as soon as he is old enough, will with perfect childish candor, make it quite clear where his affections lie In my own experience I have encountered all forms of evils arising out of allowing a nurse to retain complete and unsupervised charge of a baby, from the fostering of bad habits, which produced difficult management problems, to more pernicious practices, such as surreptitiously giving drugs and sedatives, or the milder evil of promiscuously administering laxatives In one instance, a nurse who had had practically unsupervised charge of a child for several years, was discovered to have been a sexual pervert, using the child for her purposes

These are strong charges, but they must in no wise be interpreted to mean that children's nurses must be regarded with suspicion. It means only that unless the mother is always in full control of the situation, she has no means of knowing when such evils exist. This is apart from the other consideration of the importance of the mother herself in fostering a normal mother-child relationship

Habits — The training of the child begins with his birth Good and bad habits are developed with equal ease, and in very early infancy are broken without much difficulty. The physician must take full advantage of these facts, and must be at some pains to aid and advise in the cultivation of those habits of life in the infant which will render his later upbringing less difficult. He must stress the importance of a sensible, carefully thought-out regime, carried out with clock-like regularity, and he must discourage any practices which may later lead to behavior difficulties. In earliest infancy the thumb-sucking habit is read-

paper I have been struck by one or two points which might possibly be brought out

In cutting your suture fascia, the Doctor says "cut it with a knife" The fascia splits very easily and with a knife it is like to cross some of the grains. The first time that one attempts to use this method he is surprised at the slipperiness of the fascia. We attach our

needle to one end of that fascia before we cut the other end The only failures that we have seen have been in cases where straps taken from the fascia have not been solidly anchored As far as the wound in the thigh is concerned, we have not as yet, even in compensation cases, who are particularly sensitive to everything, seen any of them complain of any disturbance from that wound

THE ROLE OF THE PHYSICIAN IN THE REARING OF CHILDREN*

By ALTON GOLDBLOOM, M.D., MONTREAL

From the Department of Pediatrics, McGill University

OW, more than ever, must the physician be regarded as the guide of those under his charge not only a guide during illness, but a guide in health as well. The advice of the physician is now sought in matters quite far removed from problems of diagnosis and therapeutics, where a knowledge of physiology, pathology, and anatomy help but little in the solving of his problems. He is not only called upon to relieve physical distress, but he often plays an important part in helping to solve many complex problems of human relationship The well-beloved, useful family physician, now fast disappearing, understood perhaps more than others how far afield from the narrow paths of the medical curriculum his daily contact with human beings often took him His were frequently problems whose solution depended not at all upon a knowledge of medicine in its strictest sense, but rather upon a wide and broadly sympathetic acquaintance with human nature, and upon the practical application of principles learned long after his graduation from the medical school

The Specialty of Pediatrics—It is to be deplored that this age of specialism, which often means the provincializing of the physician, is fast robbing us of a type which could have been developed into one of the greatest assets any country could possess Universal specialism is fast replacing the personal physician by the imper-The intimate familiar friend and sonal one. councillor is being replaced by the virtual stran-In pediatrics it can hardly be said that this intimate and personal element has been lost, or is losing ground The pediatrist is a type of general practitioner who specilizes, not in one type of disease, or in the diseases of special organs, but rather in the type of patient. He is the family physician to the children of the household. and as such is always alive, like the family physician, to all the problems which may arise in con-Like the family nection with these children physician also he must on many occasions travel far beyond his original pediatric grounding in

*Read by invitation before the Fourth District Branch of the Medical Society of the State of New York, in Ogdensburg, September 21, 1928

order to provide proper solutions for the problems which are presented to him. More than any other class of physician, the pediatrist must be in constant touch with the whole life of the child, he must be familiar with all his habits, his normal and abnormal behavior, his reactions to other children, to adults, and to his school work Only in this way can he be of greatest help to the child, not only in matters concerning his relationship with his environment, but also in matters'bearing directly upon the differential diagnosis of organic disease Czerny spoke truly when he said "The pediatrist must also be accomplished in the rearing of children, otherwise he ceases to be a pediatrist."

Child Guidance by the Physician — The pediatrist is not only consulted in matters of illness or indisposition, or difficult problems in the feeding of infants, he is regularly consulted in matters which have no relationship to illness, but which are rather related to health of the healthy infant and child, his daily routine, the proper hours for rest, play and sleep, all come within his province. He becomes, in effect, the regulator of the daily life of the child More than this, all the more difficult and far more complex problems of behavior in infancy, childhood, and during puberty are referred to the pediatrist He is consulted with regard to any bad habit which an infant or child may develop. and his advice is sought about the fostering of good habits. It is not at all uncommon for parents to send their adolescent sons and daughters to him for confidential chats, and for many or all the problems arising out of the period of transition from childhood to adult life

It would be a misplaced trust if we, as physicians, accepted the responsibility of giving advice about the rearing of children, without being adequately prepared to give that advice intelligently, if we agreed to be their guides without knowing whither to lead them

It is important therefore that the physician who undertakes to treat children should be acquainted with all the manifestations of child life from birth to puberty. He must be able to dif-

problem of behavior in an infant was solved through the proper arrangement of a feeding difficulty

Similarly all problems of athrepsia in infants, of over and underfeeding, of the type of sugar, and the quantity of fat in the mixture, of constipation, and diarrhoea, require their proper adjustment in order to prevent the development of problems of behavior which may arise out of these irregularities. A contented baby means a contented parent whose contentment is immediately reflected in the demeanor of the child

The Normal Infant — The normal infant is the one who is well fed, who is of at least average weight, and who sleeps through the night, at least from 10 pm to 6 a.m., without waking He will be quite happy when left alone, and will not cry whenever he is put down He will have no bad habits. He will expect regularity in all things because he will know no other course from the day of his birth Most of the battle of the rearing of children is won or lost in The child is indeed the father of the ınfancv man, particularly in that much of a man's inheritance is derived from his own infancy and childhood rather than from his ancestors Physicians and parents will do well to remember this, and to allow the child's ancestors to rest in peace

The Pre-School Age Period -The period of pre-school childhood, that is, from two until six and a half years of age, also presents its problem of training which, at many points, call for the understanding and advice of the physician It is during this period that the child first comes to the realization that the world does not revolve about him alone. It is then that he begins to learn that he is but one of a very large group of similar beings who have possessions which are flot his, and to which he may lay no claim, and who possess rights which he may not infringe This may give rise to conflicts whose expression may call for the counsel of the physician simplest and perhaps most common manifestations of such conflicts will take the form of the familiar tantrums of young children How to control tantrums has often taxed the ingenuity of both parent and physician We need only consider the significance of the tantrum to appreciate what the proper treatment must be tantrum usually occurs when the child is crossed, particularly when he requests something which he may not have or do The response of the parent may be twofold, the child's request may be granted, or it may be refused, the refusal being accompanied by a slap, or by some other form of punishment, not for making the request, but for having the tantrum If the request is granted, the child comes out the victor, and henceforth knows that he possesses a very powerful means of obtaining what he wants If the child is punished for having the tantrum, he may become conditioned, through fear of further punishments, into controlling his tantrums, or he may continue them as an expression of his desire to draw attention to himself. In any event, the effect is a bad one. On the other hand, when a tantrum is productive of no attention whatever, when the child is left to himself, without comment of any kind, when the tantrum is productive of no response whatever, not even a spanking, it is truly surprising how short-lived they will become, and how eventually they will cease entirely. Here is the crux of the whole question of discipline in the child between the ages of two and six years.

Breath-holding —Breath-holding is a form of tantrum. Here, however, before any disciplinary measures are resorted to, the physician must satisfy himself that no organic basis for the attack exists. Once having cleared up this point, the physician may safely advise an attitude of complete indifference to the attacks. The late Dr John Thomson, however, advised the temperate use of the slipper as a cure for these somewhat terrifying manifestations, and while I can testify to the effectiveness of this method, I believe that

indifference is an equally potent weapon

Obedience - Many of the manifestations of irritability in pre-school children owe their origin to the influence of older children should, whenever possible, be allowed to associate with children of their own age The constant presence of older children, just as the constant association with adults, is apt to place the younger child at a great disadvantage, which may reflect itself in problems of management attempts made at teaching the precocious child may have a similar effect. Too much direction is unhealthy for the child who is not old enough to attend school Yet it will be asked, "How is one to obtain obedience in the young child if direction is interdicted?" It must be answered that the young child must not be expected to obey implicitly Implicit obedience at this age is only attained through fear If you command a child to do a thing, he may respond indifferently. but if you merely wonder how quickly he could do a thing, he will at once proceed to demon-Thus young children may be wheedled into doing all manner of things which we wish them to do for themselves,-dress and undress, get into bed, go up or down stairs, and a thousand and one of the usual routine practices incident to the daily life of the child His interest is thus stimulated, his pride in himself and his abilities is encouraged, and obedience is obtained, but without any of its undesirable by-effects

Poor Appetite—It is at this age, too, owing to the great distractibility of the child, that poor eating habits may lead to chronic poor appetite. This is the most common complaint for which the pre-school child is brought to the physician. The child who is brought to the physician with this complaint is frequently already the victim of many faults of discipline which produce, with

ily broken by simple measures familiar to all physicians, the cuff about the elbow is perhaps the simplest

Crying —The advice of the physician is always sought with regard to crying The question of how long an infant may be allowed to cry is often asked, also the question of the relationship, if any, between crying and the production of herma in boys It is necessary, then, to be familiar with the various types of crying in infants, and to recognize the normal and the abnormal Most healthy infants cry between one and This is normal, healthy, reflex two hours daily crying, which is good for the baby, and calls for no attention If the baby is not spoiled on account of such crying, it will be found that the crying occurs almost at the same time each day, and that it is followed by a prolonged peaceful sleep There are infants, however, who, not knowing the difference between night and day, choose to do their crying in the night, much to everyone's discomfiture. This gives rise to the development of many bad habits in the infant, for it is at such times that rocking and "walking the floor," and sometimes the pacifier, are resorted to The advice of the physician can be of value here infant who sleeps during the day and cries during the night can easily be persuaded to reverse his This does not require jogging him about in the day-time, or making him otherwise uncomfortable in order to be made to cry It is necessary only to remove the infant from his usual Such an infant, if placed on a surroundings large bed, his clothing loosened to allow free play of the limbs, and left there to himself, will soon begin to cry lustily If this is done in the latter part of the afternoon, and the crying allowed to continue until the evening feeding is due, it will be followed by a prolonged sleep Soon the infant will develop the habit of having his cry at that time of day, and will use the night hours for sleep, as originally designed for him and for us by a wise Providence

Amusing the Baby -The influence of excitement requires consideration in some of the management problems of infants The infant, when he attains the age of "noticing," of cooing, and gurgling, and of responding to pleasurable stimulation, is in danger of becoming the plaything and indeed the center of attraction of a host of The infant takes admiring friends and relatives kindly to these adulations, even learns to anticipate them, but the mevitable effect upon his behavior soon becomes evident to his parents Irregularities in sleeping and eating, an undue amount of crying, and other manifestations, may soon lead the child to the physician, who must always be on the alert for causes, such as these, of the child's abnormal behavior

The healthy normal infant is quite sufficient unto himself, left alone, he is happier, most contented, sleeps best, and takes his food All pediatrists, and many mothers, are familiar with the infant who refuses to nurse or to take his bottle shortly after having been played with mothers learn from their own experience that an infant will feed best in a quiet, sometimes even darkened, room Here then is one very simple solution to a feeding difficulty which frequently presents itself, and which has its roots in an irregularity of early training. It will naturally be asked "When, and for how long, may a child be played with without upsetting his good habits?" The answer is never just before a feeding time, and never before sleeping time Perhaps a little gentle stimulation of this type may be given before the bath in the morning, or in the middle of the afternoon, yet it may be truthfully said that the infant who is not played with at all for the first three or four months of his life will be more happy and far more contented than the one who is subjected to however mild a form of stimulation The observer will be struck with the complete self-sufficiency, and absolute happiness, of such an infant. The physician's advice to the mother of a young infant, therefore, should be "Leave your baby alone as much

as possible."

Food and Contentment -A word should be said about the nutrition of the infant in relation to management problems Other things being equal, good nutrition and good behavior go hand in hand The well-nourished infant is contented and happy, the poorly nourished one fretful and sleepless This makes it imperative for all physicians who undertake to handle infants to have a good working knowledge of the food requirements of the infant Such knowledge cannot be obtained from the literature which is distributed by the manufacturers of well-advertised proprietary infants' foods With a good knowledge of the requirements of the infant, no food other than milk, water, and sugar, is necessary for the feeding of the vast majority of infants Without this knowledge, no proprietary food can ever be made to adequately nourish all infants. The individuality of the infant is so important a factor in his feeding requirements that special rules must often be made for a particular infant in order to keep him in a state of contentment An example of this is the hydrolabile infant who requires comparatively enormous quantities at a very young age, in order to be satisfied instance, an infant of four weeks of age was brought to me for excessive crying Despite the fact that he was consuming four and a half ounces at a feeding, it was quite evident that he was far from satisfied A second bottle was offered him immediately following his feeding. whereupon he consumed three and a half ounces more, and forthwith fell fast asleep and slept quietly through until the next feeding time From then on this four weeks' old infant took eight ounce feedings at four hourly intervals, and was a happy and contented infant. Thus a

amount of hunger The child who has teeth requires solid food in order to give his teeth their proper usage, therefore, the quantity of milk allowed is in inverse proportion to the amount of appetite for solid food, and to the degree of use to which the teeth are put

Given, therefore, an adequate quantity of D factor, which is represented by a teaspoonful of cod liver oil daily to the growing child, and given an adequacy of calcium intake as shown by a moderate or diminished quantity of milk plus a moderate quantity of curds or mild cheese daily, the amount of milk consumed per day by any child need give no concern either to the parents or the physician. I firmly believe that the propagation of this knowledge will completely eliminate all eating problems in children who have been sometimes even forced to consume large quantities of milk and cream in their daily food

The School Child—After five years of age we begin to encounter problems associated with The child in kindergarten school attendance rarely presents any problems because here no tax is made upon his brain. The difference between the pre-school and the kindergarten child is merely that play in the latter is directed sure that the kindergarten idea of directed play could be very usefully continued into the earlier school years, the play principle being used for teaching, and that in this way many problems of the young school child could be solved length of the school day impinging, as it does, upon the time necessary for free play and recreation, the archaic practice of piling home work on to young children, the necessary inflexibility of the school curriculum without much regard for individual mental capacity, all these factors play their part in producing difficulties which bring the child under the notice of the physician too, with extras, such as music and other forms of mental activity, which are imposed upon the growing child at a time when he should be using his extra hours for free play

Fatigue—All the factors which tend towards the production of mental over-exertion will express themselves through symptoms of physical fatigue and irritability,—symptoms which rarely point directly to the real cause of the trouble Such a child may manifest inattention at school, defective posture, sleeplessness, poor appetite, and lack of emotional control. The child may be suffering from mental fatigue, but may be brought to the physician for any or all of these complaints It behooves us, therefore, to familiarize ourselves with all the manifestations of fatigue in school children, in order to adequately serve them in some of their behavior difficulties. The subject of fatigue has been admirably handled by the Sehams in their excellent book, "The Tired Child," which should be read by all parents, physicians and teachers

What the physical expressions of fatigue are,

we all know We must be equally aware of the factors which lead to fatigue These are overwork, home studies and extra studies, insufficient time for recreation, and physical defects. The last named frequently come within the ken of the physician through complete physical examination, but the other factors depend for their discovery upon detailed questioning concerning the daily life of the child. Unless this is borne in mind many symptoms in children will remain unexplained. The following is an illustrative example.

A child of eight years was recently brought to me with the complaints poor appetite, restlessness at night, undue irritability, frequent crying spells, headaches, and a little loss of weight. The symptoms were of three months' duration exhaustive physical examination failed to reveal any organic cause for these symptoms tion was then centered on the child's daily life It was found that music had been added to her studies three months previously. She was not a good musician and did not take kindly to her new studies She was made to practice one hour daily after her school hours, time which she had previously spent in free play. In addition, twice a week she was obliged to have her music lesson I advised observing the effect on the child of stopping her music entirely for one week. This was followed by a complete disappearance of all Here was a child who was mentally symptoms ill-equipped to study music, and to whom the extra mental strain acted as the etiological factor in the production of fatigue symptoms. In this child, the ordinary school curriculum was not excessive, but the addition of one extra-mural subject was sufficient to change the entire behavior of the child

In the same connection we have to consider another group of children to whom the ordinary curriculum is excessive and is productive of fatigue symptoms In such children we must advise a shortening of the number of school hours in order to allow greater periods for rest and play If time permitted, a discussion of the relative efficacy of morning school hours alone for all grade school children, and the question of the complete elimination of home work, would not be out of place Suffice it to say that in schools where these arrangements have been made, the children are not one bit less bright, and their general knowledge and their class standing are as good as in those classes where the afternoon hours and home work are the order

It will thus be seen that problems apparently belonging to physical diagnosis may resolve themselves in the school child into problems of behavior and environment. To these, the physician must ever be alive

Sex Education—And now we come to the question of sex education in children, a subject on which there still remains something to be said I am afraid we have gained the impression from

his poor appetite, a vicious circle The usual faults associated with poor eating in children are first, allowing the child to spend too long a time at his meal, second, cajoling the child into eating by telling him stories, third, by allowing him to have toys at the table, and other similar practices, and fourth, by forced feeding Each of these has its bad effect upon the appetite a result of coaxing, the child will deliberately persist in his poor eating habits because of the satisfaction he derives from becoming the center of attraction Forced feeding, on the other hand, may actually develop a fear of food in a young Frequently, too, the only reward the parent may receive from forced feeding will be a prompt vomiting of the entire meal The attitude of the physician in these matters must be very definite. I am afraid that our great fault lies in dismissing these patients with a cursory examination, and a tonic containing tincture of nux vomica to be given before each meal this has a bad psychic effect upon the child, because he may gain the impression that he requires a medicine in order to be made to eat well

The treatment of these problems is not difficult if we but realize the effect of hunger in animal It is only necessary to develop the hunger of the child, unconnected with any un-pleasant associations The child must eat for one reason only, namely, that he is hungry, and this state is not difficult of achievement. The child who is allowed to spend one hour at his meal should have the time reduced to fifteen or twenty minutes Visitors and distractions must be absolutely interdicted The attitude of the parent or attendant must be one of complete indifference The food should be placed before the child, and he should be allowed to do what he will with it At the end of the allotted time it should be removed without any comment, and the child allowed to go hungry until the next meal-time, the intervals between meals being made somewhat longer A refractory child placed on such treatment may be somewhat bewildered at the beginning, and may leave one or two meals entirely untouched, but if this is productive of no apparent solicitude on the part of the parent, the argument of hunger will very soon be found to be extremely effective Frequently, when this procedure is suggested to the mother, she will state that she has already tried it, without effect, but it will be found upon further questioning that the trial lasted for the period of one or two meals must be emphasized that this procedure is one which is invariably productive of good results in the otherwise healthy child, and that it is not to be tried at all, but is to be put into permanent effect, without ever swerving from the attitude When the mother, then, is made to realize that she is not trying a treatment, but instituting a new and permanent régime, she will be willing to allow the changes for a sufficiently long period

to prove their efficacy After this, the battle with both the mother and the child is won

Habitual vomiting, not due to organic disease, but due rather to behavior, is invariably cured by this procedure. The chief weapon the mother possesses in dealing with this and similar problems is the attitude of sublime indifference. The moment the child realizes that he is no longer the center of attraction, he will not attempt to curb his natural hunger instincts.

Quantity of Milk Required—One point with regard to poor eating habits, which requires consideration, is the question of the quantity of milk which may be allowed to a child per day One frequently obtains the following history from the mother of the child who is brought for poor appetite The child refuses most of its solid food. but consumes between 30 and 40 ounces of milk per day, gets cream on porridge, and sometimes he is given top milk to drink These children, in spite of the poor eating history, are usually not underweight, the explanation being the quantity of milk consumed A child who drinks 40 ounces of milk per day consumes about 800 calories, yet a child of 3 years, weighing 31 lbs. does not require more than about 1,200 calories for its proper maintenance This means that milk is supplying such a child with two-thirds of its required calories It cannot be expected, therefore, that such a child would have much appetite left for solid food We have far overestimated the value of milk in the dietary of the older child The vitamines of milk are readily obtainable in a host of other foodstuffs, perhaps in even greater concentration The calcium of milk can be duplicated in many vegetables, or, if you will, in the curds made from milk, or in mild cheese knowledge of these facts immediately minimizes the value of statements, now many years old but still current, that a growing child needs at least one quart of milk per day. If we are to draw any analogies from the lives of lower animals, we might readily conclude that the child, once it has been weaned, actually does not need any milk at all, and I believe that experience will bear this out.

Some years ago, studies made of calcium retention in children on various quantities of milk tended to show that one quart of mulk a day was the amount which gave the optimum calcium retention, but this work did not take into consideration the effect of the vitamine D on calcium retention, and the disregard of this important fact makes the conclusions practically worthless know that in the presence of an adequacy of the D factor, calcium retention will be increased even on a minimum calcium intake, and that in the absence of the factor it may be diminished even with an excess of calcium intake Milk is a liquid of relatively high caloric value ounce given robs the teeth of a certain amount of function, and robs the stomach of a certain

Vol 28 No 21 November 1 1928

point not only of physical disorders, but also in their proper relationship to the environmental conditions of the child It is not sufficient for us to know the diseases of childhood, however protean their manifestation. We must know the child himself, in every phase of his existence, in order to serve him best and promote his normal development.

CHRONIC CHOREAS, THEIR DIAGNOSIS AND TREATMENT

By JAMES H HUDDLESON, MD, NEW YORK, N Y

TN the new classification sponsored by the American Neurological Association, chronic choreas would fall chiefly into seven groups, as follows two types of infection, viz, chronic encephalitis, (I) epidemic, and (II) non-epidemic (principally Sydenham's), one exogenous toxemia, (III) chorea gravidarum, and four types of degeneration or sclerosis, chronic progressive chorea, (IV) hereditary and (V) nonhereditary without mental deterioration, and (VI) hereditary (Huntington's) and (VII) nonhereditary with mental deterioration

I. Infection, Chronic, Encephalitis, Epiepidemic, Chorea II Infection, Chronic, Encephalitis, Non-Toxic epidemic Chorea INFECTIONS' III Intoxication, Encephalopathy, Exogen-PROCESSES ous, Toxemia of Pregnancy, Chorea Gravidarum

DEGENERATIVE PROCESSES

IV Degeneration, Brain, Chronic Progressive Chorea, hereditary V Degeneration, Brain, Chronic Pro-

gressive Chorea, non-hereditary
VI Degeneration, Brain, Chronic Propressive Chorea with Mental Deterioration, hereditary (Hunting-

ton's) VII Degeneration, Brain, Chronic Progressive Chorea with Mental Deterioration, non-hereditary

1 Developmental Defect, Brain, Aplasia, local 2 Injury, Brani, (type), (location), (cause)

Mycotic 3 Infection, Chronic, Brain. Syphilitic Granuloma, (location) Tuberculous

4 Neoplasm, Brain, (location), (type)
5 Developmental Defect, Hypothyroidism, with Myxcedema and Chorea

6 Vascular Disease Brain, (Arteriosclerosis)

Hemorrhage Thrombosis Embolism, Thrombosis,

The second of the two encephalitic infections is ordinarily deemed an acute disorder, but if the line between an acute and a chronic duration for this disease be drawn, as Dana suggests, at six months, there will be a few chronic cases About two per cent of the cases in Burr's2 series of 515 had lasted one or two years, and he found it impossible to determine in certain others whether there had been a continuous chronic illness or a series of remissions and re-

*Read at the Annual Meeting of the Medical Society of the State of New York at Albany N Y Mar 23 1928

lapses, which were likely to occur at yearly or half-yearly intervals

Together with Sydenham's (although unlike it in not being related to endocarditis and acute articular rheumatism) may be placed the other non-epidemic infectious choreas, often of adult life, which may become chronic while more likely to run an acute course. Choreas following diphtheria, measles, typhoid, sepsis, etc. should they become chronic, would belong here chorea, more liable to chronicity, is included in the non-epidemic infectious group by Dana, Lewy³ classes it with the degenerative choreas Burr found all but four in his series on a rheumatic basis, of these, two followed scarlatina and two diphtheria, though he believed that a causal connection was not established between the chorea and these last two infections

Possibly the third variety, chorea gravidarum is least likely to run a chronic course, being selflimited by the pregnancy If it were to persist after the latter's termination, the predominant etiology would be assumed to be other than the exogenous intoxication

The four groups of chronic progressive chorea comprise the more clearcut chronic types, among which Huntington's is doubtless the best known

It seems probable that there are fairly narrow localizations in the brain that may be affected by various agencies to produce the different All choreiform movements are relatively alike, so that the localization of the responsible disease-processes are thought to be essentially similar. The disease-producing agents may nevertheless differ widely

Burr is inclined to place the principal lesion of Sydenham's chorea in or near the striate Jeliffe and White would add to the rheumatic "a large number of other infections," as "interfering with fiber-carrying capacity

of an insufficient or tardily maturing and integrating motor apparatus, especially in its cerebellar static portion" Babonneix's proposition, that all chorea of the Sydenham type may be simply epidemic encephalitis, has not been generally accepted, Sydenham's chorea is better considered an encephalitis frequently associated with endocarditis and acute rheumatic fever, and ordinarily distinguishable clinically from chorea due to epidemic encephalitis A necropsted case of Sydenham's reported by Greenfield

much current literature that in frankness and in honesty to the child the entire problem of sex education magically solves itself. We are told to be truthful in our answers to the eager questions of the child,—to draw for him analogies between reproduction in plants and reproduction in animals, and to culminate the story that man is an animal and that therefore the processes of reproduction in man are essentially identical with those of the beasts of the field John B Watson goes even further, and suggests that the mother expose herself before her child, in order to completely satisfy all his curiosity at once Perhaps he hopes in this way to have the child completely jaded by the time he reaches puberty For myself, I have never been able to see the relationship between giving complete and truthful information on matters of sex to young children on the one hand, and the development of sex control on the other We must not forget that the pre-puberty and the puberty child are two different individ-It is true that sex knowledge may be imparted with impunity to the sexually immature individual, for on such a child it has no stimulating effect whatever He accepts what is told him as truth, and in a matter of fact manner questions concerning matters of sex should be answered truthfully and intelligently, merely because it is proper to be truthful to a child, but not because these truthful answers will in the slightest degree mitigate any of the problems which arise in adolescence In the adolescent, all knowledge concerning sex and all curiosity concerning matters of sex are colored by the development of sex consciousness, and in the presence of this development mere explanation, however intelligent, will in no way help a young man out of difficulties

We are faced rather with the question of proper sublimation rather than of suppression of the sex instinct. Here questions of associations, friendships, intellectual and physical activities all have their functions. We must aim to build up a high moral sense in the child, and arrange for him a life full of healthful activities. Here the clergyman, the teacher, the parent, the social worker and the physician all must play their part. Hobbies and preoccupations must be encouraged, personal independence must be fostered and the development of fears and anxieties incident to this age carefully avoided.

One potent cause of the development of anxiety neuroses in adolescents results from the fear instilled into them concerning the dangers from masturbation. It should be recognized by parents and physicians that this practice is all but universal to a greater or lesser degree in adolescents. To tell a young lad that he is in danger of becoming insane or of permanently undermining his health through a continuance of the practice, is to pave the way for an anxiety neurosis particularly if the warning has not produced any

control in the youth Far less drastic methods must be employed. He must never be told that he is in danger of anything. It must be explained to him that the practice is unnatural and not consistent with purity of mind. The appeal should be to his moral sense, but control may be attained through the encouragement of healthy physical and intellectual pursuits.

Anxieties often develop through fears instilled or developed from the occasional occurrence of nocturnal emissions. These, however, must be considered as perfectly natural phenomena and

dismissed without further comment

Adolescence - The subject of adolescence and its problems is so vast that one could hardly begin to deal with any of their complexities in one short hour Suffice it to say that, of all the ages of childhood, this is the one which requires the greatest sympathy and understanding from everyone associated with the adolescent child age, not only the child, but the parents too, require careful guidance. It is at this time that the child, with his growing intelligence, revaluates his entire environment. The child's parents, no less than others, are appraised by the child, and in the numerous conflicts incident to the age, the parents must look to it that they do not suffer through this appraisal, for then all the love and respect built up through the years of earlier childhood are in danger of destruction These are indeed the most eventful and most important years in the entire life of the individual

Punishments—I wish to say a final word concerning punishment, only in so far as it comes within the ken of the physician It is not my intention to discuss this subject from the stand-point of the parents The physician is often told of instances in which a child is punished for occurrences over which he has no control One notable example is bed wetting. This is not an uncommon admission from the parent in the consulting room Again we often learn of children who are frequently punished for the crime of being too exact a replica of one or other parent The influence of the physician can here be brought to bear, first in indicating the general futility, if not the dangers of most forms of punishment, and the cruelty of punishing a child for acts which are not at all volitional The greater our understanding of children, the less will be our tendencies or desires to punish them

Know Children—You have honored me by listening to this poor attempt to glance over a vast subject in the twinkling of an eye. It is like the story of the heathen who came to the sage Hillel and asked him to teach him the whole of the law in the time that he could stand on one foot. However, I hope I have succeeded in indicating some of the points of contact between the training of the infant and child in the home, and the work of the physician. We must ever be on the alert to properly evaluate all symptoms, physical, emotional, and behavioristic, from the stand-

genital syphilis Its claims have been urged chiefly by French authorities Babonneix13 suspects that it determines particularly the chronic, severe, and refractory cases of chorea minor Whether a chorea is rheumatic and simply complicated by syphilis, or non-rheumatic and caused by the latter, may be questionable in any given case where chorea and syphilis are concurrent Blood and spinal fluid findings might corroborate the syphilis without excluding a rheumaticcardiac-choreic or an epidemic encephalitis syndrome Camp notes two cases, clinically congenital syphilis, in which recovery from chorea followed antiluetic therapy, although the serology had been quite negative Armand-Dehlle and Vibert¹⁴ report a case of eight months' duration in a four-year-old child whose movements were suggestive but not quite typical of rheumatic chorea there was hyperglycorrhachia (087 gm) but no ocular signs, while the blood showed a slightly positive Wassermann This was a case probably of epidemic encephalitis, and possibly complicated by syphilis (cf infra, Richon and Cornil)

In the borderland between true chorea minor and various types of myoclonic spasm are found such cases as the one recently reported by Van Bogaert and Sweerts ¹⁵ This they classed as an example of the "electric chorea of Henoch-Bergeron" Beginning at the age of five, it was still persistent and practically unchanged at nine, exhibiting three types of abnormal spontaneous movement electric clonic movements of wide extent, small choreoathetoid movements resembling chorea minor, and clonic movements like those of Unverricht's myoclonus-epilepsy "Electric choreas," either of the Hénoch-Bergeron or the Dubin (acute only) type, are considered myoclonias rather than true choreas

Chorea of pregnancy, though separated from chorea minor in the classification as an exogenous toxemia rather than an infection, seems particularly likely to occur in individuals who have had one or more previous attacks of the infectious type. There is a tendency in the literature to combine the psychogenic with the organic choreas of pregnancy, so that conclusions regarding the latter are difficult to draw. Whitmore in finds that choreas in pregnancy do not predispose to spontaneous abortion, also that relatively few become chronic—3 percent in Buist's series which he quotes

The possibility of choreogenic exogenous toxins outside of pregnancy has been suggested by Fuchs (quoted by Herman), who produced choreic movements in cats by the use of guandine Urechia and Elekes mention a claim that similar movements had been produced by iodoform

Hereditary chronic chorea without mental deterioration is uncommon, assuming that one does not include those members of Huntington's chorea families who develop its choreiform movements some years before the mental signs, and may therefore die without having shown the typical mental picture. Sachs and Hausman¹⁸ separate a hereditary chronic type beginning at about puberty and persisting through life, with choreic movements affecting the face and hands but sparing the lower extremities, there are no acute attacks, no remissions or relapses, there may be mental depression but not deterioration

Non-hereditary chronic chorea without mental deterioration is less uncommon, and seems often enough to have been complicated if not caused by syphilis In a sixty-year-old individual recently cited by Richon and Cornil,10 a chancre was acquired at the age of thirty, chorea (its movements identical with those of Huntington's but unaccompanied by the latter's mental picture) appeared at fifty-four, and a gumma at fifty-eight. This chorea was unaltered by antisyphilitic treatment Another chronic non-hereditary chorea reported by Daday, Abely and Bauer20 began at forty-six after syphilis in youth, and was complicated by a chronic manic state with agitation and elation from about the age of fifty, this was not a case of paresis

Quite a different type of non-hereditary chronic chorea was described by Urechia and Mihalescu²¹ in a twelve-year-old child, no actite infection except icterus neonatorum (which they emphasize) occurred previously to the onset of moderate choreiform movements of limbs and trunks at about the age of two months. There were various stigmata of degeneracy, general weakness and hypotonia, and diminution of both ankle jerks Enunciation of speech was in a monotone.

A case seen at Bellevue Hospital may be included here.

S K, a Russian Jewish barber, aged 50, was admitted to the Neurological Service of Bellevue Hospital under the care of Dr Foster Kennedy, May 15, 1928, complaining of inability to control movements of the arms and legs

The family history was negative for nervous, mental, or other familial diseases. In the personal history, from 1913 to 1925, i.e., over a period of 12 years, he suffered from chronic osteomyelitis of the right humerus, for which he underwent 17 operations under ether anesthesia. He also had two operations for stones in the bladder

The present illness began gradually one year after the operations, or two years ago, with involuntary movements of all the extremities. He cannot say whether one or another was affected first, but thinks that the face was involved last. The movements have always become worse on emotion and ceased at night.

The physical picture in the gross suggests something between Sydenham's and Huntington's chorea. The twitchings are not so coarse, there is less grimacing, and the gait is better than gen-

and Wolfsohn⁶, showed an accompanying endocarditis, with cerebral vascular changes (many small vessels thrombosed) and small-celled infiltration of the brain substance outside the perivascular lymph-spaces, almost confined to the brain (exclusive of the brain-stem) and quite as marked in the white matter as in the gray These changes were particularly intense in the head of the caudate nucleus and in the internal capsule

Chorea minor, as is well known, is evidenced by irregular, non-purposeful, relatively quick twitching movements, with incoordination and hypotonia, and with or without appreciable weakness of voluntary movements, grimacing not following a constant pattern, possibly indistinct or confused speech, irregular jerking of the head and shoulders, stumbling at times, either the incoordination during movement or the twitching during rest may predominate Asynergia and adiadokokinesis may be readily elicited, hypotonia is evidenced by signs such as the "choreic" posture of the hand (flexion at the wrist and hyperextension at the metacarpo-phalangeal joints) The speech-defect is a dysarthma, not an aphasia, a choreic "bark" has been described, differing from an hysterical "bark"

Muscular weakness may appear a short time before the choreic movements. Chronic minor choreas with weakness and hypotonia but without choreic movements would not be expected, and would be diagnosed with difficulty. In the acute stage, a severely paralytic Sydenham's with the minimum of twitching might be mistaken for an acute anterior poliomyelitis, but there could be no error in the chronic stage of such a chorea, when no trophic or electrical changes in the muscles would be expected.

With a chorea lasting over six months as one symptom, an epidemic encephalitis should at least have shown previous lethargy or excitement, disturbances in extra-ocular movements and in pupillary reactions, if not myoclonic signs as Pupils in Sydenham's may be dilated or normal, but react well, they are more likely to react poorly in epidemic encephalitis The typical cardio-arthritic association of Sydenham's chorea would be absent in the epidemic disorder, similarly the former's occasional rheumatic sub-The form of the chorea cutaneous nodules itself should be of some diagnostic value Movements of the tongue are particularly typical in Burr states that the movements in Sydenham's epidemic encephalitis where Sydnham's chorea is suspected, are likely to take the form of a local myoclonus rather than a chorea They are prone to shift in location and vary in quality Sydenham's chorea, when chronic as well as acute, shows movements of fairly constant quality and of comparatively slower changes in distribution, although changes in intensity may be more rapid The possibility of a sequence like that in a casereport by Urechia and Elekes' should be kept in mind first the picture of chorea minor, later a more definite myoclonic syndrome, and finally a typical post-encephalitic parkinsonism

The mental condition of chronic encephalitic choreics is not a constant one Emotional depres-The well-known consion has been mentioned duct-disorders in young post-encephalities though rare with parkinsonism, may or may not accompany hyperkinetic disturbances of choreiform (Borthwick) ⁸ Sydenham's chorea (and this applies to its chronic forms) is said to have a distinct facies-Burr calls this a "look of wistfulness," though he suggests that it is probably due to changed tone of the facial and ocular muscles rather than to a particular mental attitude. He does insist on "mental symptoms in every case," and finds emotional instability an essential Whether a patient with part of the disease Sydenham's chorea should characteristically show a neurotic makeup is a disputed point, so that the fact of its presence or absence cannot be used in differential diagnosis among the choreas Ebaugh emphasizes the emotional lability, extreme fatigue, and intellectual incoordination seen in his series of minor choreas, but these were mainly acute cases and it is not certain to what extent the mental characteristics would tend to persist into chronicity pars passu with the physical Ebaugh also notes the frequent occurrence of mental apathy and restlessness fifth of the individuals in his series showed delinquency in addition, this finding is scarcely mentioned by other writers, and what connection it may have with the better known conduct disorders of epidemic encephalitis is not clear. One possible explanation may be tentatively offered, recalling that Ebaugh's cases were often related to fatigue and but rarely to rheumatism, and that they were prone to show disturbances in sleep a number of them might have been due to epidemic rather than to non-epidemic encephalitis, an hypothesis which would be compatible with his findings taken together

Serologic findings may be diagnostically help-The cerebrospinal fluid in either Sydenham's or epidemic encephalitic chorea may show a lymphocytosis and slightly increased globulincontent and pressure, down to a total absence of abnormal findings as in Mestrezat's 10 example of Sydenham's Camp¹¹ found the spinal fluid normal to all tests in a series of Sydenham's chorea An increased fluid-sugar (in the absence of increased blood-sugar) would be evidence in favor of the epidemic encephalitic variety crease was found in Urechia and Elekes' case A colloidal gold reaction in the form of a syphilitic or paretic curve (together with negative fluid-Wassermann) is quite compatible with an epidemic encephalitis (Davis and Kraus12)

There is another prominently possible etiology for non-epidemic infectious chorea, namely con

and adjacent tracts Voudouris27 suspected tubercle in his case of hemichorea of two years'

standing

Involuntary movements succeeding a localized cerebral vascular insult may be choreic, athetosic, or mixed, and will be limited to one side of the body unless there should chance to be analogous (Athetosis consists in slower bilateral lesions movements of abduction and adduction, flexion and extension, most marked in fingers and toes, and less widespread over the extremity than are choreic movements) Vascular cases in which chronic hemichorea has been preceded by transitory hemiballismus (violent throwing about of the extremities) not accompanied by hemiplegia, have been observed by Goodhart, Wechsler and Brock,28 and by Martin 29 Hemichorea with hemiplegia in early infancy is more likely to be post-hemiplegic than Sydenham's, the history of a cerebral birth-injury and a tendency of the movements to be choreic-athetosic would establish the diagnosis Sachs and Hausman found posthemiplegic chorea occurring in six per cent of infantile cerebral palsies, although rarer than posthemiplegic athetosis

Since we have taken choreas to be organic diseases, a psychoneurotic form is ruled out a conversion hysteria simulating chorea minor may be difficult of differentiation. In the functional disorder there are likely to be more definite and longer free intervals than in the organic, between the occasions when choreic movements are The so-called chorea of hysterics is more sudden in onset, more rhythmical in type, and other hysterical characteristics or sensory stigmata should be found Traumatic neuroses exhibiting functional choreiform movements are not well-known though not impossible Among other functional conditions, "chorea major" is really major hysteria and quite unlikely to be confounded with chorea minor Tics and habit spasms are distinguishable by their purposive character and fixed pattern They are also quicker, more closely localized and less incoordinate It has been said that "tics are unconscious and voluntary and do not destroy function, choreic movements are conscious and involuntary and do destroy function"

In the treatment of a chronic infectious chorea with signs of congenital syphilis, specific antisyphilitic treatment should of course be tried For chronic chorea in epidemic encephalitis, salicylates or non-specific protein therapy may be used as described below for chronic cardioarthritic chorea Arsenicals are not recommended in the epidemic-encephalitic type Good results may follow the use of sedatives like phenobarbital and bromides Hyoscine hydrobromid (gr 1/100) or less), is sometimes useful against choreatic symptoms The hygiene and habit training to be mentioned under rheumatic chorea would require modifications for adaptation to epidemic encephalitis on account of the latter's changeability

and greater chronicity

Chronic chorea minor of the Sydenham cardioarthritic type-often enough improper handling has prolonged the acute into the chronic stage—is treated much the same as acute chorea, by rest in bed with more or less isolation, followed for some time by gradually lessening restrictions of physical activity, by warm baths or packs, daily to less often as needed, by diet, lacto-vegetarian with gradual expansion, by medication, and on this point authorities differ Sedatives may be needed temporarily Arsenical preparations have been longest in use against the symptoms of the acute stage, and may still be used in the chronic if neuritis or other evidence of intoxication from too great an accumulation of the drug Fowler's solution up to tolerance is avoided (m II to X t 1 d) is probably in commonest use, but arsphenamine intravenously, or sulpharsphenamine or sodium cacodylate intramuscularly may be tried Sulpharsphenamine gave good results in Moffet's series, three doses of 2 to 3 gm were injected at five day intervals Ebaugh recommends a short series (6) of weekly injections of tryparsamide, gm 1 to 3 Whatever the mechanism, less is to be expected of arsenicals in chronic than in acute cases of chorea minor, the same is true of salicylates, which may also be used either by mouth or intravenously and preferably in large doses to tolerance

Dwyer's⁵¹ recommendation of intravenous killed typhoid bacilli (20 to 40 million per weekly dose) for acute chorea minor, might well be adopted in chronic cases, as non-specific protein treatment of this sort has sometimes been useful in other chronic neurological conditions chief difference between the drug therapies of these acute and chronic cases is seen in the use of codliver oil, iron (particularly syrup of ferrous iodide), and other tonics, also a more stimulating diet, in the chronics Certain choreics, like some epileptics, seem to have been benefited by calcium and parathyroid, but this method is by no means well worked out Finally, many of the chronic therapeutic problems differ widely from the acute in requiring active re-education and social readjustment. Fatigue is still to be avoided Movements that remain as habits must be eradicated wholly or partly by psychotherapy individual and his family must be brought back from the idea and the adjustments of invalidism, whereas in the acute stage it often requires considerable effort on the physician's part to persuade them, particularly the family, in the opposite direction toward considering the symptoms as those of physical ailment and not simply of a nervous habit

Although the advisability of eliminating sources of possible infection, as carrous teeth, is clear enough, it is notable that tonsillectomy has not given uniformly good results in infectious chorea

erally seen in Huntington's; there is less evident hypotonia than usual in Sydenham's. On walking, as on any other muscular effort, the twitching of the face, arms, and legs are all lessened, on attending to questioning they are increased. Movements are wider and more numerous of the left side of the body than of the right, and are practically constant during examination. Just a suspicion of athetoid movements are occasionally seen in the left hand and foot. There is an occasional movement of inward rotation of the right arm, which tends to be held with hand on thigh and in inward rotation at the shoulder and wrist. No similar tendency is seen in the other extremities.

The tongue twitches as in Sydenham's, and there is occasional smacking of the lips. Speech is practically normal. Except for choreiform twitchings of the face and a little inconstant external strabismus of the left eye, the cranial nerves are negative.

The upper extremities show some asynergia and dysdiadochokinesis (more of the left), but the finger-nose test can be done well. There is no voluntary weakness and little hypotonia. The deep reflexes are moderately increased, and equal on the two sides. There is slight hypæsthesia of the right arm distal to the scars (of the operations noted in history).

The epigastric, abdominal and cremasteric reflexes are normal. There are no sensory dis-

turbances of the trunk or legs

The lower extremities show equally increased reflexes on the two sides, no Babinski or other abnormal reflex, and no ataxia. There is no

swaying in the Romberg position

The general condition tends toward a moderate emaciation The viscera are normal, blood pressure is 140/60, there are no signs of syphilis and the blood Wassermann test is negative. There is a little glycosuria (sp. gr. 1032), a trace of albumin and a few hyaline casts. Mentally the patient is of medium intelligence and shows nothing psychopathic.

The etiology of this chorea might depend upon the prolonged sepsis from the osteomyelitic infection, or possibly upon the repeated exposure to ether in anesthesia. It is not clear what connection, if any, may exist between the chorea and

the disturbance in sugar metabolism

Huntington's chorea, the hereditary type with mental deterioration, is characterized chiefly by the form of the movements, which are coarse and grimacing, and less localized than in infectious chorea, comparatively violent jerks of the legs cause a difficult and grotesque gait, the choreic movements are more easily inhibited voluntarily, and motor power is generally undiminished. As a rule the reflexes are unchanged. The usual late age of onset in Huntington's (thirty to forty years) aids in the differentiation, as does the heredofamilial character of the disease. Physical

and mental signs do not necessarily appear simultaneously, and it is probable that the one symptom-complex may be inherited without the other Owensby²² describes a case unusual in its early onset in a girl at the age of four, when choreic movements began in the head and neck, physical development slowed, and mental sluggishness soon appeared, at seven, the patient's age when reported, no psychosis could yet be determined, but was to be expected since the progenitors of three preceding generations had become psychotic, there were general Huntington's choreic movements, a stumbling gait, sluggish and indistinct speech, the reflexes were normal and there were no paralyses

The cardiac rheumatic picture is not seen in Huntington's as in Sydenham's, although an exception to this rule has been reported (Clancy²⁸) Jakob describes two cases of non-hereditary chronic degenerative chorea following articular

rheumatism

Turning from the generally recognized causes of chorea to others theoretically possible, we may allude again to Jeliffe and White's conception (quoted above) which suggests that there should be choreas based upon one or more forms of developmental defect Lewy points out that some such defect is not an unreasonable postulate for the hereditary types Certain of the nonhereditary congenital cases may have a similar etiology, although our present knowledge seems insufficient for diagnosing a chronic chorea as due to a local aplasia. It might be suspected in one of the cases reported by Babonneix and Lévy 25 this patient, then 51 years of age, had had unchanged choreic movements since the first mont! of infancy, not preceded by any known infection, the chorea had not been complicated by athetosis, sensory changes, altered reflexes or pyramidal signs, or cerebeller symptoms, but there was hypotonicity The speech was nasal, irregular, almost incomprehensible at times There hac also been periods of violent anger and unreasoning fear (psychometric findings were not reported)

In an individual possessing an insufficiently intergrating motor apparatus, some physical trauma might conceivably precipitate a choreic response which could become chronic. However, one must recall that the vast number of cerebral injuries observed during and after the great war, while they furnished enough post-traumatic epilepsies were not productive of choreas (except an occasional choreiform hysteria). Choreic movements appearing after cerebral injury would certainly arouse suspicion of their probably functional origin as part of a post-traumatic psychoneurosis.

A case of chronic hemichorea apparently due to pressure was reported by Bignami and Nazari, in which a solitary tubercle was found in the region of the cerebral peduncle, affecting the superior cerebellar peduncle the red nucleus,

ARTERIOSCLEROSIS IN THE LEGS AND HEART IN DIABETES* HOWARD F. ROOT, M D, BOSTON, MASS

ARTERIOSCLEROSIS in the legs and in the coronary arteries is increasingly manifest in the great mass of diabetic patients over 45 years of age, and constitutes one of the chief problems for the future of younger patients

Evidence of the existence of arteriosclerosis in diabetics comes first from autopsies. In 55 autopsies arteriosclerosis was present in the aorta, coronaries or kidneys in all but 7 cases. Of these 7 cases 5 were patients less than 30 years of age whose diabetes was of less than 2 years' duration. In one case only the kidneys and pancreas were examined and in the last case a woman of 42 years, diabetes was of but 6 months' duration. Every case with diabetes of 5 years duration has shown arteriosclerosis including a boy of 16 years.

X-ray examination of the legs by Drs Mornson¹ and Bogan have demonstrated calcification of the arteries in increasing amount with increasing duration of the disease. Thus the percentage of the total number with duration of 5 years was 40, during the 2nd five years 56, and 92% after 20 years. With rare exceptions every patient with diabetes of 10 years duration has shown calcification in the vessels of the legs, and it was found present in cases as young as 16 years.

Ophthalmoscopic examination of the eyegrounds showed arteriosclerosis in 20 per cent of 307 cases reported by Drs Spaulding and Curtis²

What distinctive features are found in the arteriosclerosis of diabetes? Clinically the predominance of gangrene and coronary disease as compared with uremia and cerebral hemorrhage as a cause of death is striking, and in over 55 autopsies not a single death from cerebral hemorrhage or uremia occurred

Coronary Disease and Angina Pectoris

In reviewing the records of 4676 cases of diabetes 122 cases of angina pectoris or coronary occlusion were found, their frequency increasing with the duration of diabetes. The incidence of angina pectoris trebled in the second 10 years of the disease as compared with the first

In the 122 cases of coronary disease the onset of diabetes definitely preceded that of angina in 106 cases. The males numbered 71 and females 51 in contrast to the usually much greater preponderance of males. Is the more equal sex incidence of angina pectoris in diabetes due to the levelling influence of diabetes in curtailing physical activity and the development of arteriosclerosis? Hypertension was more common in the females. In fatal cases the duration of diabetes averaged 95 years in the males and 104 years.

in the females The duration of angina was 21 years in the males and 14 years in the females. The apparently short duration of life was due in part to the mildness of the early symptoms. Careful questioning is often necessary to elicit a characteristic history in the diabetic.

The varying manifestations of coronary disease often puzzle surgeon and internist alike. Case No 1794 aged 33 years, with diabetes of 8 years duration was sugar free at 3 p m. At midnight she waked with pain in the left shoulder and vomited. By noon the next day acidosis was extreme. Pain over the sternum, vomiting and Stokes Adams seizures were followed by death and at autopsy coronary calcification and occlusion with infraction of the interventricular septum and left ventricle were found. Similarly Case No 4721 aged 62 years died in coma not affected by insulin. At autopsy a large area of infarction of the left ventricle was found.

In 15 cases the combination of gall stones and

angina pectoris was present.

Hypoglycemia and coronary occlusion occurred in Case No 1520 who entered the Hospital at midnight with a blood sugar of 04 03 per cent. At least 3 other cases of fatal coronary disease during or just after a lowering of the blood sugar have been observed.

In 55 autopsies coronary sclerosis was present in 33 cases Changes in the coronary arteries as in other elastic arteries such as the aorta and the splenic, are of the same type as in non-diabetics They consist of a thickening of the intima or inner coat with the invasion of fat-filled endothelial leucocytes and deposition of fat especially as cholesteum esters at first chiefly at the branching of arteries and later the deposit of lime salts and sometimes the formation of bone. With necrosis of superficial layers, ulceration occurs and we then find the typical calcified placques in the aorta with ulcerated areas containing soft amorphous chalky material which occasionally may be the source of an embolus Medial degeneration and calcification may also be present but the intimal change is characteristic In the coronary arteries of diabetics the process appears accelerated, and intensified in degree.

In the muscular arteries of the extremities the typical arteriosclerosis of the non-diabetic is medial, as best described by Monckeberg. Here there may be slight thickening of the intima with some fat deposition, but in the media are found swollen and necrotic muscle fibres, large deposits of calcium and even bone formation.

In diabetic patients a somewhat different picture is presented. I have attempted to analyze the records and pathologic findings in the leg arteries of 33 diabetic legs amputated for gangrene or infection to determine whether these findings have

^{*}Read at the Annual Meeting of the Medical Society of the State of New York, at Albany, N Y, May 23, 1928

Ebaugh doubts its value, Gerstley and Wilhelmi³² found that it influenced neither the course of the disease nor the development of recurrences (in 27 cases)

In the choreas of pregnancy, therapeutic abortion is to be considered in addition to other treatment—but in the chronic case this operation will either have been decided against or already performed In one of Urechia and Elekes' cases, considered by them to be of the infectious group though possibly aggravated by pregnancy, therapeutic aborption was followed by exacerbation The value of abortion is also guestioned by Kaffesieder,38 who prefers sedatives in most cases

In the chronic group characterized pathologically by degeneration or sclerosis, little is available by way of therapy, but the sedatives useful in the other choreas may afford some symptomatic relief here Prophylaxis via eugenics seems the most effective attack Huntington's at least tends to commence and terminate earlier in successive

In other organic brain diseases accompanied by chorea, there is no specific therapy generally accepted outside of whatever may be appropriate to the predominant pathological condition tives (as phenobarbital) may be used

In psychoneuroses, the treatment of choreiform movements will be that of any type of conversion hysteria

SUMMARY

Pathologically, different choreic pictures are apparently referable to lesions in closely related Clinical diflocalizations of the striate system ferentiation remains important since treatment still appears to depend more upon the exciting cause than upon the focus

The choice of medication for chronic infectious choreas (non-epidemic) lies among arsphenamine derivatives intravenously or intramuscularly, non-specific protein intravenously, and salicylates intravenously Hygiene must play an The same treatment, with the important rôle exception of arsphenamines, applies to choreas with epidemic encephalitis

Chronic degenerative choreas derive little benefit from medication, except some symptomatic

relief from sedative treatment

In 15 cases the combination of gall stones and angina pectoris was present.

Hypoglycemia and coronary occlusion occurred in Case No 1520 who entered the Hospital at midnight with a blood sugar of 04 03 per cent. At least 3 other cases of fatal coronary disease during or just after a lowering of the blood sugar have been observed.

In 55 autopsies coronary sclerosis was present in 33 cases Changes in the coronary arteries as in other elastic arteries such as the aorta and the splenic, are of the same type as in non-diabetics They consist of a thickening of the intima or inner coat with the invasion of fat-filled endothelial leucocytes and deposition of fat especially as cholesteum esters at first chiefly at the branching of arteries and later the deposit of lime salts and sometimes the formation of bone With necrosis of superficial layers, ulceration occurs and we then find the typical calcified placques in the aorta with ulcerated areas containing soft amorphous chalky material which occasionally may be the source of Medial degeneration and calcificaan embolus tion may also be present but the intimal change is In the coronary arteries of diacharacteristic betics the process appears accelerated, and intensified in degree.

In the muscular arteries of the extremities the typical arteriosclerosis of the non-diabetic is medial, as best described by Monckeberg. Here there may be slight thickening of the intima with some fat deposition, but in the media are found swollen and necrotic muscle fibres, large deposits of calcium and even bone formation.

In diabetic patients a somewhat different picture is presented. I have attempted to analyze the records and pathologic findings in the leg arteries of 33 diabetic legs amputated for gangrene or infection to determine whether these findings have

any relation to the types of gangrene, and the development of accessory collateral circulation. The amputations were performed by Dr L S McKittrick and I am indebted to Drs L W Smith and Shields Warren for the pathologic data

In these 33 cases, sections from anterior and posterior tibial, dorsalis pedis and popliteal arteries at various levels were obtained instances we also injected the amoutated legs with barium sulphate through the popliteal artery in order to obtain Roentgenograms of the circulation The group consisted of 12 females and 21 males ranging in age from 52 to 75 years with diabetes varying in duration from a few weeks to 24 years The Wassermann test was negative in all cases Treatment of the diabetes had been very slight in nearly all cases In two instances insulin had been used for 1 year but in the remaining cases insulin had only been used for periods varying from 2 days to 3 months before operation Hypertension was present in 26 of the 33 cases, but it was not possible to determine from histories whether hypertension had preceded the diabetes or not The lesions in 29 cases began in a toe or an infected callus on the sole of the foot In 6 cases only was pulsation felt in the dorsalis pedis artery cases the obliteration of circulation was unaccompanied by a precipitating trauma and amputation was done to relieve pain. In 4 cases the lesion was primarily due to infection so severe and extensive that in spite of fair circulation amputation was necessary in the attempt to avert death from In 25 cases gangrene was present septicemia with infection

Two types of lesion were found differing chiefly in the degree of intimal as compared with medial involvement, and exemplified in the following descriptions

1 Endothelial proliferation and fatty deposi-

"The lumen is reduced to 1/6 normal size. Numerous endothelial leucocytes filled with hemosiderin are seen in the lumen, but the bulk of the lumen is occluded by huge lipoid-filled endothelial leucocytes, some connective tissue ingrowth and moderate infiltration with endothelial leucocytes and lymphocytes"

In the media there is a small focus of necrosis, infiltrated by lymphocytes, polymorphonuclears and endothelial leucocytes with occasional calcified granules and necrotic muscle fibres

2 Medial calcification with intimal change

"There is marked calcification of the media with some bone formation. The lumen is reduced to 1/5 normal size. Marked thickening of the intima with large deposits of atheromatous material and toward the media, infiltration with endothelial leucocytes and lymphocytes."

Criteria of scleratic change Intimal changes in the least degree consist merely of hyaline thickening With more advanced changes hyaline and loose fibrous tissue thickening is present, infiltrated by endothelial leucocytes containing fat Cholesterin crystals are frequently present. The varying degrees of change are shown as follows

+ = Reduction of the lumen to at least 2/3 of the original size.

++ = Reduction of the lumen to from 1/3 to 2/3 its original size

+++ = Reduction of the lumen to less than 1/3 or to obliteration

The varying degrees of change in the media are classified as follows

+ = Hyalinization, swelling or necrosis of some muscle fibres

++ = Slight to moderate calcification with little if any distortion

+++ = Marked calcification or bone formation with considerable distortion of the medial boundaries

Sections from each artery were classified according to this schedule with respect to intimal and medial change. The totals for each vessel are shown in the following table

Relative Incidence of Intimal and Medial Sclerosis in Arteries of the Legs

Cases	Po	pliteal			Posterior Tibial		Dorsalıs Pedis	
Diabetes 33	Int	Med.	Int. 72	Med. 50	Int. 59		Int.	Med 21
Non-diabeti	c ,	1	1	0	2	_	1	4

Thrombo-angitis obliterans was not found in this series. Medial sclerosis of the Monckberg type is found in varying degrees in most cases, but the characteristic feature is the predominance of intimal changes. In the diabetic, therefore, the pronounced intimal fatty change found in non-diabetics usually in the elastic arteries extends early to the muscular arteries of the extremities.

This type may develop fairly rapidly as shown by its presence in cases with diabetes of but a few months' duration. That it may be present for long periods before the onset of gangrene is shown by the long duration of diabetes in certain cases, but especially by the existence of calcification and even bone formation within the intima. In cases with diabetes of long duration the best development of collateral circulation was found, but in cases of short duration, advanced intimal change and absence of compensatory collateral circulation obtained. The occurrence of gangrene seemed to depend upon the presence of infection before the development of adequate collateral circulation.

What clinical bearing have these pathological variations? The most valuable circulatory asset for a diabetic with sclerosis of the main arteries is a good collateral circulation and in certain cases we were able to make special studies of the colla-

teral circulation by means of barium injections and X-rays From them as well as from the group as a whole it appeared that the cases with longstanding medial sclerosis had developed the best collateral circulation, whereas cases with relatively little medial sclerosis and marked intimal change Tentatively the had little collateral circulation conclusions seem justified that, (1) diabetes encourages the early extension into the arteries of the feet of the intimal type of atheromatosis usually found chiefly in the elastic arteries of the trunk, (2) that a good collateral circulation is best developed when the medial type of sclerosis has been present for some time, (3) that as soon as diabetes is discovered in a person over 50 years of age it is advisable to attempt by means of exercises similar to those of Buerger or by other means to stimulate the development of collateral circulation

Etiology

(1) Essential hypertension cannot be established in any considerable number of cases since the cases were not under observation long enough. The fact that cerebral hemorrhage is becoming less frequent as a cause of death suggests that the type of arteriosclerosis ordinarily found is not that produced by essential hypertension.

(2) Alcohol is used but little by diabetics and

hardly needs to be considered

(3) Syphilis is no more common among diabetics than among non-diabetics

(4) Diet—(a) Carbohydrate is the food of choice for patients developing arteriosclerosis. It could only cause it by producing obesity

b) Protein—everyone agrees that an excess of protein favors rather than prevents arteriosclerosis and a limitation to 1 gram per kilogram body

weight is generally accepted for an adult.

c) Fat—Deposits of fat in the arteries chiefly as cholesterin and cholesterin esters characterize arteriosclerosis Schonheimer by chemical analysis has shown the striking increase in content of cholesterin of arteriosclerotis as compared with normal aortal. Until the discovery of insulin the diabetic diet made up in fat what it lacked in carbohydrate and most diabetics of that period were subjected to a diet relatively high in fat Is its effect upon the arteries to be explained by the imbibition theory of Virchow and Aschoff?

According to Aschoff⁵ arteriosclerosis begins as a swelling of the ground substance of the intima due to physiological strain and followed by imbibition of plasma. This atheromatous process can begin at any age but proceeds more rapidly in the aged arteries. An excess of fat and especially cholesterin in the blood is not the initial cause but it determines the character of the process. Aschoff should be quoted in full

"There is a second factor that must be present before these atheromatous spots may appear This, it seems to me, is a sufficient concentration of lipoids, especially of cholesterin esters in the plasma. From plasma of low cholesterin content no deposition of lipoids will occur, even though mechanical conditions are favorable. The greater the concentration of the cholesterin esters in the plasma, the more surely will the areas of the aorta subject to the greatest mechanical strain show this fatty deposition even microscopically

This may, however, entirely disappear in malnutration, especially when there is a deficiency of lipoids in the diet. This accounts for the decrease in atheromatosis in the later years of the war and in the post-war period in Germany.

While in youth a reversibility of the process through a reabsorption of the lipoid substances is doubtless possible, such an involution of the atheromatous patch in the period of senescence is absolutely excluded. Resolution of the marked process of swelling and the fatty change, which is usually considerable, is all the less likely, since the organism in this period tends to develop precipitation processes. That is why in the senile period the atheromatous process not only reaches an extraordinary degree but undergoes further transformations that are entirely absent in youth necrosis occurs. In the necrotic tissue there is

progressive splitting-up of the lipoid elements in particular. The cholesterin is freed and crystallizes out in the familiar crystals. As has been described by Klotz, the fatty acids form the usual soaps, the most important of which is the calcium soap, since this leads to incrustration and calcification of the atheromatous deposit and the tissue surrounding it. In this way there develops the peculiar impregnation of the atheromatous patches with their placques of calcareous and bony hardness, which completes the picture of athersclerosis. The character of the diet remains the most important factor."

The well known disturbance of fat metabolism in diabetes produces an increased concentration of fat and especially cholesterin in the blood. Deposits of cholesterin occur not only in the diabetic arteries but in the gall-bladder with the result that in our autopsies 31% of cases over 25 years of age have gall stones. Cholesterin deposits in the skin as Xanthoma are common. Whether Aschoff's theory is proven correct or not, at present it seems to fit the diabetic.

What a hopeful prospect it gives! The arteriosclerotic change reversible in its early stage. If this be true, by better use of dietary treatment and insulin we should be able to postpone arteriosclerosis in the diabetic until his age entitles him to it.

Treatment

Formerly a diet as low as 10 to 40 grams of carbohydrate and relatively high in fat was necessary to ward off coma or starvation. Now with insulin no such limitations are imposed. Remem-

ber that the diabetic's best defence against acidoses is a store of glycogen in the liver and that the muscles burn only sugar When carbohydrate burns then fat is completely burned more than brief periods should the supply of carbohydrate in the diet be less than 50 grams per In general we should aim to provide a diet of 100 grams of carbohydrate or more and especially in the arteriosclerotic, arranging his insulin, exercise, and other components of his diet so they will surely be burned

The arteriosclerotic heart seems to be especially dependent upon an adequate supply of sugar Hypogylcemia occurs when least expected and is most fatal in the aged arteriosclerotic. Van den Bergh, Nicely, and Edmondson and Budinger have also commented upon the dangers of a low blood sugar when coronary disease is present. Therefore be slow to make sudden and marked reductions in the diet of a diabetic with angina Insulin should be used cautiously and in small doses

In summary, Arteriosclerosis, sometimes premature, and its consequences are becoming the chief cause of death in diabetics

(2) Examination of the arteries of diabetic legs suggest that the specific effect of diabetes is

to produce an acceleration and extension to the muscular arteries of the fatty intimal change usually found in the elastic arteries, which may occur rapidly

(3) Consideration of the antecedent obesity, of the disturbance of fat metabolism, of the types of diet used in the past tend to support the Aschoff theory of arteriosclerosis as it develops in the diabetic.

(4) It appears probable that in its early stages the premature arteriosclerosis is reversible and preventable

- (5)The diet of the arteriosclerotic should contain 100 or more grams of carbohydrate with sufficient insulin to insure its utilization but with a constant watch for hypoglycemia
- (6) In any diabetic over 40 years of age exercises to stimulate the development of collateral circulation in the feet and legs should be begun immediately

BILATERAL VASECTOMY FOR THE PREVENTION OF EPIDIDYMITIS IN PROS-TATISM

By MAURICE MELTZER, MD, NEW YORK, NY

THE occurrence of epididymitis some time during the course of a prostatectomy is a most distressing and undesirable com-This complication occurs in 20-40% of cases, whether the operation is done perineally or suprapubically and it is interesting to note that not only does it occur in ward cases, but on the contrary, the incidence seems to be greater among private patients occur even without any instrumentation of the urethra, after the insertion of a retention urethral catheter, after a first stage cystotomy, soon after the enucleation of the prostate or when the patient makes the first effort to void The complication naturafter the operation ally causes the patient much pain and precludes any necessary instrumer ation of the urethra The patient's stay in the hospital is prolonged, an unwelcome situation from a psychological point of view Very often, palliative measures against this condition are unsuccessful and orchidectomy with drainage of the scrotum must be done The physical and mental condition of older men is such that everything should be done to prevent a drain on their resistance from complications Is there anything that can prevent such a complication as epi-

didymitis? The author feels that there is and recommends bilateral vasectomy, a minor surgical procedure, as a definite prophylactic measure against epididymitis

A vasectomy can prevent epididymitis by closing the communicating channels that exist between the prostatic urethra and the epididymis through the lumen of the vasæ deferentiæ When a section of the vas (about 3% of an inch) is cut away and the ends tied, there is practically no chance for the ligated ends to anastomase with each other. It therefore seems to the writer more advisable to do vasectomy, than vaso-ligation, as is practised at Johns Hopkins Hospital (Brady Urological Institution) If the vas is merely tied in two places, communication between the two ligated ends may be renewed after removal of the silk worm Bilateral vasectomy, when properly done is almost never followed by epididymitis. though epididymitis has followed vasectomy. in these instances the scrotal contents may have been handled rather roughly

It has been noted above that epididymitis may occur even without instrumentation of the urethra It should not be overlooked that a small amount of debris, blood clot or granulating tissue, can be aspirated through either orifice of the ejaculatory ducts (situated in the prostatic urethra on the verumontanum) The foreign material is carried downwards through the lumen of the vas deferens and deposited usually at the lower pole of the epididymis Either a mild inflammation sets in or pyogenic organisms invade the epididymis, pus forms in it and the process soon spreads to the testicle Like all other inflammations of the epididymis, an inflammatory hydrocele accompanies it, and a purulent condition ensues if the serous fluid in the hydrocele sac becomes In some instances the infection is severe enough to break through and spread to the scrotal sac Should this condition persist longer than four or five days and there is increased swelling, pain and temperature-orchidectomy and drainage of the scrotal sac must be done Prompt relief should follow

In the past thirty years urological surgeons have reduced the operative mortality in prostatic surgery markedly. The mortality rate is now as low as 3% to 4% in the hands of trained urologists This low mortality rate is due not so much to improved operative technique, but rather because careful preliminary "check up" is made of these older men by various clinical The potential and laboratory examinations resistance of middle-aged and older men is well determined by the following routine Urine analyses and specific gravity tests, estimation of residual urine, palpation of the prostate and microscopic examination of its secretion, cystoscopic study of the urinary tract, x-ray of the genito-urinary tract, kidney function tests by the total estimation of dye output in the urine and by examining the blood for retention products (blood urea, creatinine and sugar), and by careful examination of the cardio-vascular system (including blood pressure and electrocardiogram) The urologists' operative mortality is lowered and the end results improve almost in direct ratio to the care with which these pre-operative studies are It is the purpose of this paper to emphasize the importance of bilateral vasectimy as an addition to the urologist's armamentarium for the prevention of a most undesirable and weakening complication

When should vasectomy be done? If a patient is sent to the hospital with acute retention, vasectomy should be done before the emergency cystotomy. If a patient is sent in for a two-stage supra-pubic operation, vasectomy should be done just before and simultaneously with the cystotomy. If a one-stage supra-pubic or perineal prostatectomy, preceded by a urethral retention catheter, is contemplated,—vasectomy should be done on admission to the hospital and before the urethral retention catheter is inserted. Inasmuch as

epididymitis may develop at any time in the course of surgical operations for the relief of prostatic obstructions—vasectomy should be done as soon as the patient enters the hospital

Vasectomy has also been utilized by the writer in major surgical operations on the lower urinary tract in men who are 50 years or older Carcinoma of the bladder, carcinoma of the prostate, cases of vesical calculi with varying degree of bladder neck obstruction in all these the question of procreation is of no It is however of the utmost importance rather to save these patients from such a complication as epididymitis. In such cases the vasectomy should be done simultaneously with and just before the cystotomy the lithotrite is to be used for crushing vesical stones, the indication for vasectomy still exists, because of trauma possible to the posterior urethra by this instrument

The following table details the type of cases in which vasectomy was done

Two stage prostatectomies for adenoma	28	times

HistoricalEarly urologists sectioned vasæ deferentiæ not to prevent epididymitis, but on the theory that the hyperplastic gland would diminish in size and thus relieve the urinary obstruction Between 1885 and 1896 Guyon, Birket and Hilton and Harrison did this operation to reduce the size of the gland. Vasoligation was advised as a prophylactic against enididymitis by Proust in 1904 and later in 1909 by Albarran Some time ago E Beer tried out vaso-ligation in altogether different types of cases In conjunction with epididymectomy for genital tuberculosis, he practised vaso-ligation on the opposite and apparently healthy side in the hope of preventing tuberculosis of this side This did not prevent the tuberculous formation because the tubercle bacilli are carried to the epididymis via the blood stream In the past two or three years urologists have become interested in the relative frequency and importanc of epididymitis in private as well as in ward cases and vasoligation and vasectomy are now done more extensively

Technique of the Operation After trying out various methods of approach to the vasæ deferentiæ, the following procedure has been adopted About ½ inch below the external abdominal ring, a one inch incision is made on

the anterior aspect of the scrotum clamps are placed on either edge of the wound and the subcutaneous tissues are spread with a clamp or scissors The entire spermatic cord is then lifted out of the wound with an Allis clamp In this way the vas deferens can definitely be felt and differentiated from the other cord structures The hard, cord-like vas deferens is then picked up with an Allis clamp and is dissected free from its connective tissue It is clamped in two places, about 1/2 inch apart, about 36 inch of vas deferens is cut away, the ends ligated and the entire spermatic cord is then dropped back into the wound There is usually no bleeding As a precaution against a hematoma forming from a tiny bleeder, a small rubber drain is inserted and usually one silk worm gut is used for the scrotal tissue Bilateral vasectomy takes from 10-15 minutes time and is done under local or spinal anæsthesia. The scrotum is kept elevated for the next week or so The sutures are usually removed in two to four days and the healing is entirely uneventful This is really the only reliable method of performing vasectomy The palpation through the uncut scrotum is very misleading and deceptive

E P Alyea writing on this subject, in an article in the Journal of Urology, January 1928, advocates a different technique. Frontz, Colston and Alyea, all of the Baltimore Brady Urological Department, feel for the vasæ through the uncut scrotum, pick up the vasæ with a special vas clamp, traction is put on the vas and a special needle with two strands of silk worm gut is passed through the skin, under the vas and the vas is thus tied the time of their writing, this method was effective in their 50 cases While this method may be a very good one in their hands-it is not all as simple and easy as it reads Certainly this method should not be recommended Any one who has handled many to tyros spermatic cords, must know how difficult it is to definitely feel and isolate the vas in some Even with the open method described above, time and again, a cord-like structure that feels absolutely like a vas, is on careful inspection and further palpation found to be a sclerotic and thickened blood vessel very simple by the open method to graciously

drop back this wrong structure and pick up and ligate the vas If experienced operators meet such thickened vessels, which to the outside sense of touch, feels just like a vas-how easy it is for the inexperienced to tie off the wrong structure and thus frustrate the very purpose of preventing epididymitis Because the vas can easily slip from one's grasp regardless of the type of clamp used, because even in the open operation it is often a delicate thing to find and isolate the vas, because the open operation on both sides can be done in ten to fifteen minutes under local anæsthesia, and because by combining the sense of touch and vision the wrong structure is never ligated, it is inconceivable why any one should grope blindly and uncertainly for a thin cord-like structure, that is often as slippery and as elusive as the proverbial eel. The few extra minutes are entirely well spent-for in truth it can be said that 15 minutes spent in doing bilateral vasectomy may save the patient two weeks and most often more of invalidism with the most distressing pain and the likelihood of additional surgery to drain the infected epididymis

Conclusions

- 1—Bilateral vasectomy, rather than vaso-ligation, is a definite prophylactic measure against the painful complication of epididymitis
- 2—The operation is best done by the open method Both vasæ can be ligated in about 15 minutes under local anæthesia
- 3—Vasectomy should be done when the patient is admitted to the hospital, even before inserting a retention catheter
- 4—Epididymitis occurs in 20-40% of cases, both in private and ward cases and whether the perineal or suprapubic operation is done
- 5—Vasectomy should also be employed in men over 50 in operations of the lower urinary tract such as carcinoma of the bladder, carcinoma of the prostate, etc
- 6—Vasectomy should be added to the urologists armamentorium in conjunction with the preliminary routine studies to determine when or whether the patient is fit to undergo major surgical procedures

A CORRECTION

We wonder how many of our readers discovered an error in the numbering of the pages of the October fifteenth Journal. The last reading page of the October first Journal was 1204 and the first page of the October fifteenth issue is numbered 2005 and the error was carried through the entire number

We assume that we are permitted to make three major typographical errors in the course of the year, and a dozen minor ones, and we have not exhausted our allowance in either class We trust our readers are as kind as President Roosevelt. who said he would excuse an error provided it was not repeated

THE FRATERNITY OF THE MEDICAL PROFESSION

HE healing art is as old as the human race It was born in the maternal instincts of the higher animals, and the need for its practice has existed as long as accidents and sickness have It was recognized as a profession when men of power and sympathy became known for their special knowledge and skill in detecting the hidden cause of disease and sickness, and were sought out because of their ability to adjust defective parts of the human mechanism These men were held in honor because they knew the living forces which to all other persons were hidden and mysterious Hence a practitioner of medicine was called a "Doctor," a word which means taught or learned The physician was especially accorded the title of Doctor because his learning enabled him to control the most important characteristics of a human being-his health and life The most practical boon a man could bestow on another, was to restore a helpless one to strength and usefulness and happiness

The practice of medicine has always been surrounded with a halo of mystery which it did not deserve. The mystery of medicine has consisted in the fact that a learned few have possessed knowledge which the great majority of the people in their ignorance could not grasp or appreciate. The physician was a miracle man in the estimation of other persons, including princes and kings. But while politicians capitalized the alleged mystery of healing rites yet the medical profession has always been ready to impart its secrets to men of ability and character who could be trusted to use their knowledge for the benefit of humanity

The first hospitals were temples, and the first medical records were the votive tablets donated by grateful convalescent patients in order to record their symptoms and treatment for the benefit of other sufferers Hippocrates gained his extensive knowledge of the art of medicine by copying case records from tablets which were publicly exposed in the temple for the benefit of those who would study them It was only the quacks and pretenders who capitalized the mysteries of medical practice and the credulity of the people early physicians were pictured as old men with flowing grey beards studying long scrolls or copying clinical records in the temples There was nothing mysterious about the physician or his

surroundings, but the whole picture suggested hard study and deep research, and experience which comes only with years. These men were the progenitors of modern practitioners of medicine who traced their scientific lineage back to devoted students and research men in the ancient temples of Greece and Egypt.

The attitude of the medical profession in ancient times, as at present, is that the practice of medicine is founded on scientific facts. Sometimes experience in a long series of cases has indicated a successful method of treatment, long before its scientific basis has been discovered, and sometimes a scientific fact has been applied in the healing art years after it was discovered by scientific research, but always the attitude of the medical profession has been to publish the facts and describe the methods of their application, whether in the public tablets on the temple walls, or in medical journals, or even in its latest development in the field—newspapers—by means of articles written by representative physicians

The mystery of the unknown has always been in the practice of medicine, and the medical man will always appear to be "Doctor" or "learned" to his brother citizens The practitioner of medicine today must spend eight years in hard study before his lay brethren, the people, will permit him to be known as "Doctor", and he must spend as many more years before his medical confreres will accede to him a reputation for special learning But to those who have passed the necessary test of medical knowledge and experience, the medical profession is the fraternity of things hidden from the uninitiated Medical men have no fear that secrets acquired only by years of work may be appropriated by one who listens casually to a medical paper, or skims through Osler's "Practice of Medicine" as if it were a modern, light novel The ancient landmarks of the medical profession go back to the dawn of history, but the golden age of medicine hes not in the distant past, during which scientific secrets were lost through the unworthiness of weak signs of demigod discoveries, the greatest opportunity that medicine has ever known lies with the present generation of physicians whose medical societies are both schools and fraternities, and who seek to follow the advice of St Paul-"Prove all things, hold fast that which is good"

RESULTS OF THE ANTI-DIPHTHERIA CAMPAIGN

The physicians of New York State have conducted an anti-diphtheria campaign for over three years. That in New York City has been largely centralized in the City Department of Health, with the advice of representatives of the County

Medical Societies (see page 1308)

The campaign up-State like that in the City of New York has been conducted by the trinity of public health workers, the physicians, the departments of health, and the lay health societies, each doing its part. The Medical Society of the State of New York has a special committee on diphtheria immunization, whose Chairman is Dr N B Van Etten, past-president of the State Society (See this JOURNAL October 15, page1249) This Journal of May 15, page 604, contains a record of the immunizations so far as they were reported to the State Department of Health immunization of children has been the work of physicians and they have done their duty so well that the reduction in diphtheria has been marked The State Department of Health announced that during August 146 cases of diphtheria were reported from New York State, exclusive of New York City Among these 146 cases there were six This record may be compared with that of July 1908, when 31 deaths occurred out of 108 cases reported, but obviously many more cases existed besides those reported While the willingness of physicians to give toxin-antitoxin was the greatest factor in securing the immunizations, the education of the people was also essential,

and in this education great credit is due to the newspapers Not only did they publish accounts of clinics and print them in a form that made the administration of the immunizations attractive to the children and their parents, but also they printed educational articles prepared by health officials and members of publicity committees of county medical societies Most remarkable and creditable was the response of the newspapers to statements issued by the Commissioners of Health of the State of New York, and of New York For example, an appeal issued by Health Commissioner, Dr Shirley W Wynne, during the second week in September resulted within a week in the publication of editorials and articles in at least fourteen leading newspapers of New York City and State.

New York State is to be congratulated on the willingness of its physicians to perform their civic duties in protecting the people against diphtheria and other contagious diseases. However, the following thoughts are pertinent

A pastor who converts a sinner from the error of his way adds a financial contributor to his congregation

A physician who immunizes a person against a disease would bring on his own financial ruin if he were able and willing to prevent all diseases

Moral The physician who conducts an immunization clinic is worthy of his hire and deserves remuneration from public funds

LOOKING BACKWARD

This Journal Twenty-Five Years Ago

Prescribing Proprietary Remedies—Physicians twenty-five years ago were not protected by the efficient food and drugs act which requires that the composition of foods and drugs shall be printed on the container. The question of prescribing remedies of unknown composition was often discussed a quarter of a century ago, and appeals were made to physicians to prescribe remedies according to their composition rather than their trade names and the claims of the manufacturers

This Journal of November, 1903, contains the president's address given on October 21, 1903, by Dr F H Wiggin, President of the New York State Medical Association, from which the fol-

lowing extract is taken

"Among the many abuses by individual members of our profession which must be rectified is that of freely prescribing medicine of unknown composition, a practice which is frequently indulged in at the present time. In an article on this subject, entitled "The Objections to Prescribing Medicines of Unknown Composition," by

Professor A A. Eshner, of Philadelphia, the following statement is made

"From the foregoing considerations it must be clear that the prescription of medicines of unknown or concealed composition is unscientific, unprofessional, unfair if not prejudicial to the sick, unprogressive and unstimulating, and, most of all, unnecessary

"'The remedy for the existing state of affairs is in the hands of the medical profession. The manufacturing pharmacists will not make preparations that they cannot sell, and if physicians will not permit the creation of an artificial demand for illegitimate preparations, and will cease to prescribe them, the manufacturers will soon discontinue their production. To this end it is the duty of all medical men having the interests of their profession and their patients at heart to confine themselves to the employment only of such drugs or combinations of drugs whose composition is of public knowledge, and, further, is vouched for by some recognized authority."

MEDICAL PROGRESS

The Gelatinous Disease -Under this title Prof Kummer, surgeon at the University of Geneva, describes the condition commonly called pseudomyxoma of the peritoneum, which has been known since the time of Cruvelhier (1848), who however confused it with colloid cancer, although impressed by the points of dissimilarity with malignant disease scription as we know it today was the work of Péan in 1871 The author shows that it may take its departure from the ovary, the ascend-In the author's ing colon, the appendix, etc personal case which he gives in full, the patient was a man of 76 with chronic suppuration of the right flank from two fistulous tracts The pus was mixed with a gelatinous substance Despite the drainage a tumorous mass was seen to be forming No diagnosis was made, although a cold psoas abscess from vertebral disease was the first thought occurred from intercurrent uremia Only at the autopsy was the condition cleared up and found to have developed on the basis of an appendical abscess in the retroperitoneal re-The conclusion of the author is that the condition in question is not a clinical entity but is always secondary to some primary The lesion is originally cystic and perforation of the cyst wall gives rise to the The gelatinous so-called gelatinous ascites matter may be seated within or without the peritoneal cavity In some of the cases which originate in the ovary and intestine there is a malignant element, but the appendicular cases have always been benign -Schweiserische medizimsche Wochenschrift, July 7, 1928

The Heart During Anesthesia and Operative Procedures-H M Marvin is of the opinion that far too much has been said of the stress and strain that fall upon the heart as the result of anesthesia and operation, and that unquestionably many patients have been deprived of the benefits that might have followed operation because of a baseless fear that the heart would be seriously, or even fatally, damaged by the procedure No matter what size the heart may be, no matter what thrills or murmurs may be present over the precordium, or how far they may be transmitted, if the patient has been leading a life of moderate activity and has been without symptoms, the heart may be regarded as the equivalent of a normal one, and it may be safely assumed that it will behave properly during anesthesia and operation To this statement there is one exception—the syphilitic heart If the history

indicates early heart failure of the congestive type, physical examination becomes a matter of importance If symptoms of heart failure are absent while the patient is at rest, and physical examination shows no evidence of visceral engorgement, the heart will do perfectly well In such patients, perhaps the safest single guide is the presence or absence of râles at the lung bases The only important arrhythmias are auricular fibrillation and heart block Patients with heart failure and those with auricular fibrillation should receive digitalis before operation if possible Digitalis should not, however, be given as a routine preoperative measure When it is employed it should be administered in therapeutic doses The results of a comparison of two similar groups of surgical patients, one of which had been completely digitalized before operation, indicate that digitalis does no good whatever. but actually does harm Of the available general anesthetics, ethylene is probably the one that has most to commend it for use in patients Possibly the most imporwith heart failure tant factor of all is that it is far more essential to select the proper anesthetist than it is to select the proper anesthetic -New England Journal of Medicine, September, 1928, excix, 12

The Use of Sulphocyanate of Sodium in Cases of High Blood Pressure -In an investigation into the action of the sulphocyanates on blood pressure, Arthur D Smith and R D Rudolf studied individuals with normal blood pressure and those with heightened pressure Normal persons, after receiving 5 grain doses of sodium sulphocyanate in water, three times daily after meals, reacted by a fall in systolic pressure of from 15 to 30 mm Hg in the period of one week Some 70 cases in which the main feature was high blood pressure were divided into three groups according to the dosage employed In the first group the dosage was 5 grains of sodium sulphocyanate three times daily in water after food, in the second group 5 grains twice daily, and in the third group a dose of 21/2 grains twice daily was used It was found that this small dose was sufficient to obtain the effect, the pressure having been lowered in every case in the latter It usually required from eight days to two weeks before the systolic pressure fell to any extent. In patients showing much kidney damage or arteriosclerosis the effect is least evident, but usually occurs to some ex-The best results were obtained in the cases coming under the heading of "essential

hyperpiesis" In the sulphocyanates the authors believe we have a symptomatic remedy which may often be of value in chronic hyperpiesis. They have been observed to have a sedative effect and are often mildly hypnotic. They are easy to administer and not unpleasant to take in aromatic mixture—Canadian Medical Association Journal, September, 1928, xix, 3

Treatment of Circulatory Failure in Acute Infections, Especially Croupous Pneumonia -Professor Schottmüller of Hamburg states that we are often helpless against the vasomotor paralysis of acute labor pneumonia, which is mostly responsible for the 20 per cent mortality of this affection We have some good remedies and it is astonishing, he says, how little use is made by the profession of intravenous strophanthin, which in his experience is far superior to any of the preparations It is true, of course, that many of digitalis fear to make use of strophanthin, in part because of the strictures of certain writers, although the fact should not be overlooked that these same men do sometimes make use of the drug To raise the tension of the peripheral vessels we have a group of drugs of which adrenalin, used by the intravenous drip method, is one of the best, but here also there may be some untoward drug action. The author advocates the initial use of intravenous strophanthin and if this fails or if untoward action develops he adds or substitutes the permanent adrenalin-saline intravenous drip The author takes the case of 20 patients in whom the sometimes magical action of strophanthin intravenously was not realized and who were then placed under adrenalin as above mentioned Ten of these patients recovered and 10 died One of the recovered group and two of those who died were moribund at the time of injection, one was 78 years old and an alcoholic, one already suffered from mitral stenosis, and another from pernicious anemia, two children suffered at the same time from scarlatinal sepsis Of the three others one is unaccounted for in the table and one had reached the age of 49 The remaining decedent, a man of 30, died on the fourth or fifth day of the disease The duration of the infusion was from 6 to 772 hours -Deutsche medizinsche Wochenschrift, September 14, 1928

The Wheal Test and Predisposition to Edema—Drs Eisner and Kallner, of the internist clinic of Prof H Strauss of Berlin, refer to the test of McClure and Aldrich which was published during 1927 and which they have applied to a study of 75 cases They, however, varied the saline solution in using the full 09 per cent solution in place of the 08 per cent employed by McClure and Aldrich

The test was made in cases of venous stasis, natural and artificial edema, etc, and the duration of the wheal was noted. Some patients tested were due to develop edema while others had recovered from the same It was also sought to determine the average duration in the normal subject and this was found to be about 55 minutes, the limits being 40 and 85 minutes In testing in venous stasis the position of the limb was varied from the horizontal to the hanging and in determining normal values the former was selected In the hanging and elevated positions there was some variation but the duration could be shortened as well as lengthened In addition to the hanging posture Bier's method was also used to produce venous stass of a higher degree, but in no instance was the duration increasedusually the reverse In edema the duration was diminished in both hanging and horizontal In what the authors style preedema the duration was much shortened for the most part-from 10 to 40 minutes-while in post-edema this also held good. This tendency to abridge the duration the authors regard as the result of injury to the capillary network, whether seen in stasis or in edema, as indicated by the use of the capillary micro-The chief practical use for the test is in pre-edema and to some extent in post-edema -Klinische Wochenschrift, Sept 2, 1928

Clinical Studies of Adrenalectomy and Sympathectomy -George W Crile, writing in the Annals of Surgery, September, 1928, lxxxviii, 3, reports a series of 29 cases in which an attempt was made to treat certain diseases which are apparently related to adrenal activity by adrenalectomy alone, by adrenalectomy associated with thyroidectomy and sympathectomy, or by sympathectomy alone (in two cases) The series includes 13 cases of epilepsy, 4 cases of neurasthenia, 2 of endarteritis obliterans, 5 of hypertension and 4 cases of hyperthyroidectomy with hypertension study of the end-results in the cases of epilepsy shows that adrenalectomy alone is practically without effect, the combination of adrenalectomy, thyroidectomy, and sympathectomy, however, has modified the course of the disease in certain cases, four out of five cases having shown definite improvement and one having been completely cured In the cases of endarteritis and of hypertension the results were negligible, and they were inconclusive so far as neurasthenia is concerned cases of hyperthyroidism and hypertension there was an immediate but not permanent effect upon the hypertension and in every case the basal metabolism was reduced operations, however, have been performed too recently for the results to be considered as

end-results Adrenalectomy is performed through a left oblique lumbar incision, with the patient in the "kidney position" There is usually a marked fall in blood pressure during and immediately after operation, this lasts for some hours, sometimes for days, and the fall is greater at the radial pulse on the side on which operation is performed. No pigmentary change was observed in any case, and the removal of a single gland apparently does not even approach the margin of safety Excision of the cervical sympathetic is made through the usual incision employed for thyroidectomy There was no operative mortality in this group of cases

Diabetes Secondary to Disease of the Gall-Bladder-Professor G Katsch of Frankfort on-the-Main begins with the statement that there is nothing novel or surprising about this association because the pancreas is often involved in gall-stone disease, nevertheless the actual literature is scanty and the case reports are widely scattered. The author mentions a few personal cases It is evident that these may come to attention when a gallbladder patient has his urine tested, but the opposite condition may also occur, in which a patient with known diabetes complains of acute pains in the pit of the stomach French author actually described a so-called "painful diabetes" as a clinical type of the disease Among systematic writers the association of the two affections is sufficiently recognized-thus Wohrmann found in 24 per cent of diabetics either old or actual cholecystitis, but this author has only recently made this report public and Katsch is mostly silent about the older authorities. This percentage was not obtained by autopsies but as a result of surgical diagnosis, followed or not by cholecystectomy Owing to the fact that both of these affections are extremely common one wonders to what extent the association is a mere coin-This obtains especially when there is a conjunction of an old gall-bladder trouble with a recent diabetes The percentage of gallbladder disease in diabetics was once given by von Noorden as but 21/2 and this might have been regarded as for the most part comcidence, but the much greater figure of Wohrmann is far too large to be explained in this manner The question also comes up as to the severity of the diabetes, for in the statistics there is no distinction between severe and relatively mild forms It may be that gall-bladder disease is occasionally responsible for a special type of mild diabetes, while cholecystectomy, which in theory might arrest this form of diabetes, has been itself accused of setting up a mild type of the same - Deutsche medizinische Wochenschrift, Sept. 7, 1928

Insulin in Undernutrition.-Prof R Bauer of Vienna, one of the first to test the injection of insulin for emaciation, contributes a new paper after three years of further trial His optimism is retained although there is an allowance to be made for the proper choice of cases and suitable dosage The original single dose of 20 units cannot well be increased while the frequency has been somewhat reduced In place of 2 to 3 in 24 hours he now does not exceed 2 doses These precautions are for the prevention of hypoglycosemia Incidentally the author has tested the treatment upon himself, probably less with the aim of putting on weight than to experience the collateral action of the remedy, although during the three weeks period of treatment he gained nearly The most striking subjective experience was the unusual increase in the appetite He found he could blunt this unpleasant craving for foor by eating any kind of carbohydrate There were a few other unpleasant sensations from the drug, such as formication and a sense of insecurity Asthenics and enteroptotics seem to profit especially from the treatment, while psychopathic cases may prove refractory and indeed become worse. If benefit is not apparent by the third or fourth day. he would break off the treatment. Of numerous symptoms complained of by the patients under treatment many are attributed to the unusual consumption of food As for the tuberculosis only the latent cases benefit and the treatment is of no value in senile atrophy It has been the exception for a hyperthyroid patient to benefit As for the theory which underlies this treatment and the striking results in favorable cases, much has been written and most of the paper is devoted to this angle of the subject. The rationale may differ somewhat with the type of patient. The author seems inclined to consider the possibility of a psychical factor in the asthenic, who often has the feeling of inferiority While the body is the first to benefit the mind shares in the improvement at a later period and the morale is raised -Klinische Wochenschrift, September 9, 1928

Report of a Case—Agranulocytic Angina With Recovery—Tyree C Wyatt finds 80 cases of so-called agranulocytic angina recorded in the literature. As one goes over some of these reports he meets cases of throat infection and atypical blood pictures which suggest the probable relationship of agranulocytic angina to so-called monocytic angina or infectious mononucleosis. The cases reported seem to warrant no conclusion as to the etiology. Most writers are agreed that the disease is primarily an infectious one, though they are not in accord as to whether the throat

infection is primary or whether it is secondary to a low grade blood-infection Wyatt's case belongs definitely to the agranulocytic group The patient, a woman, aged 43 years, was indisposed for about three weeks before coming under observation There was involvement of the tonsils and the whole pharynx, together with a firm tender mass in the left submillary region Later localized infection appeared in the infraclavicular and left axillary regions The bacteriological findings in all these areas were inconclusive The blood culture was negative. The leucocyte count, which was 1,800 when the blood was first examined, reached 700 five days later, the differential count at this time showed 5 per cent polymorphonu-As at the end of eleven days the patient's condition was not at all hopeful abcesses were drained, and following this procedure the temperature fell to normal within three days, the blood picture gradually returned to normal, and recovery was complete in six weeks -New England Journal of Medicine, September 13, 1928, excix, 11

Allergic Phenomena and Their Consequences -Dr A Mühling writes with particular reference to a single case reported by him at great length The patient was a robust man of 59 of untainted stock, who was first attacked with a swelling of the left leg with a weeping dermatosis which healed after nine months leaving behind a pigmented skin From this time on there was frequent recurrence in various localities of the condition known as Quincke's disease or angioneurotic edema, which was in part hemorrhagic This in turn was succeeded by a marked enlargement of the liver with ascites, although singular to relate this last complication underwent a rapid involution without trace Upon its subsidence the areas of edema again asserted themselves, although only temporarily A period of freedom from all symptoms now followed, but the hepatic swelling and ascites returned and were this time accompanied by vomiting and diarrhea with rapid failure of health and fatal issue, the terminal symptoms, confirmed by partial autopsy, being those of atrophic cirrhosis of the liver In discussing this paradovical case the author seeks the primary seat of the disease in abnormal capillaries which readily permitted the escape of serum and blood corpuscies, although the point of departure may likewise have been an abnormal liver The alternative would ascribe the swelling of the liver and ascites to the same permeability of the capillaries. In angioneurotic edema the nervous system, and especially the autonomous portion, is usually accused, but in the present case a satisfactory mechanism is not evident. The author can only suggest a sensitiveness to certain kinds of allergens and the presence of one of the latter which should have been an active chemical substance of nature quite unsurmised. It does not appear that the patient was tested for sensitiveness to various allergens—Munchener medianische Wochenschrift, Aug. 31, 1928

Nature of Landry's Paralysis -L Hollaender and L Karoliny of the First Medical Clinic and Institute for Pathological Anatomy respectively of Budapest University state that after an analysis of the known material there is doubt as to whether the spinal cord or peripheral nerves are more at fault They then describe two personal cases of which the first, in a man of 26 ran a very acute course, the patient living but 16 days after presenting the first symptoms of the disease This case appeared to correspond fully to a severe ascending polyneuritis which conformed to the Landry syndrome The second case was in a man of about the same age as the first and the patient survived but 13 days A complete neuro-logical examination could not be carried out, but the picture was also that of a polyneuritis The histological examination of the two cases led to the same finds notably, the presence of pneumococci in abundance within the substance of the affected peripheral nerves There were changes in the cord in both cases but these were clearly due to extension from the nerves As far as the authors are aware this is the first time in which virulent microorganisms have been demonstrated in the nerves. whether in Landry's disease or any other kind Associated with these nerve of neuritis lesions in the structures examined were evidences of persarteritis nodosa, although this seems to have plaved a subordinate role. This affection, as is well known, is general but bears considerable resemblance to the cases above cited occurring chiefly in young males and pursuing an acute and fatal course neuritis is an incidental lesion in perariteritis The mechanism of infection is obnodosa In certain cases the polyneuritis appears to be a sequel or complication of influenza, while in a few others encephalitis seems to have been the forerunner - Münchener medızınısche Wochenschrift, September 27, 1928

LEGAL

By LLOYD PAUL STRYKER, Esq. Counsel, Medical Society of the State of New York

THE DOCTOR AND THE LAW*

The title of this paper indicates a topic as broad as history, as extensive as science and as wide as Would that my capacity to dishuman nature cuss it were coextensive with the theme Twice during each month I pause in the midst of the preparation or the trial of cases involving doctors' rights and their good names, to fill two or more pages of the New York STATE JOURNAL OF MEDICINE with an editorial upon some subject designed to be helpful to the medical profes-Especially in a series now running I have been endeavoring to discuss a considerable variety of topics in the domain of medico-legal To my surprise, I am told by iurisprudence physicians that these editorials are read, I shall, therefore, here endeavor to avoid, among other faults, the error of repetition

To me, as perhaps to no other layman in this state, is accorded the opportunity of a close and intimate contact with the problems, the triumphs, the disappointments, the discouragements, the satisfactions and especially the ideals of the medical profession The doctor in our modern civilization plays a part all too little understood and He is the appreciated by the general public friend and the wise counsellor of man in his hour of pain and need Despite the unprecedented advances of science within the past half century, the doctor still practices not only a profession, but an art,-the healing art Despite all the new scientific equipment, both of knowledge and of apparatus now at the doctor's disposal, it is probably as true now as in the days of Hippocrates that doctors are born and not made yet, no doctor however marked his natural talent, can serve the patient of this day without the knowledge and ability, the industry and the inclination to place at his patient's disposal the benefits which our recent science has conferred upon mankind

I would be repeating that which you already know far better, were I to enter into a prolonged discussion (assuming that I were able to do so) of the progress of medicine since George Washington became President of the United States And yet as a humble onlooker and a sincere admirer of your profession, I can never speak of the doctor without recalling what he and his brother scientists have accomplished within the brief span compassed by not more than three normal lives

* Delivered before the Sixth District Branch of the Medical Society of the State of New York, on September 25 1928

In 1796 vaccination for smallpox was discovered, fifty years later came anaesthesia, while within the past fifty years Pasteur performed his immortal work. It was he who discovered that fermentation and all other decomposition processes in organic matter are the result of micro-But not only did he discover the organism as a cause for these conditions, he devised effective measures for their control From the suppression of anthrax that had waged its unrestricted warfare against both man and beast, he passed on to hydrophobia, and only thirty years ago brought forth the means of controlling that disease "Pasteur's work," said Dr William Allen Pusey, a former President of the American Medical Association, in a paper recently delivered before the American Bar Association, "converted a germ theory of disease into a germ knowledge of disease The part played by bacteria in wound infections and in infectious disease is now no more a theory than is the part played by steam in the steam engine"

As I stood a few weeks ago on the banks of the Seine and entered with uncovered head the mausoleum of Napoleon the First, and as I gazed down into the crypt at the marble sarcophagus containing all that was mortal of the greatest of all soldiers, enveloped in the almost theatric yellow radiance that shines through the stained glass windows, I experienced the emotions which so many Americans and all Frenchmen have there felt As I looked about the tomb I saw inscribed upon a wall the dying wish of Bonaparte that he might lie on the banks of the Seine among the French people whom he loved so well

From the tomb I passed on to the museum where rest the battle flags of the Great Emperor and the batons of his marshals Gazing at these and other relics of the wars that devastated Europe for two decades, I reflected again upon Napoleon's dying words, they seemed now to have been written as with some strange irony people that he loved so well! Napoleon died a captive at St Helena and all his empire and his conquests became as dust and ashes,—as dead as the remains of the man for whom Louis Phillippe erected this great sanctuary of France Frenchmen under Bonaparte rallied in innumerable battalions to the roll of his drums and the call of his bugles, and died by the thousands in forgotten graves, while the women of France shed their tears and put on their mourning These Frenchmen died a hero's death, the death

of the martyr, and yet the cause of mankind, the real progress of the people whom Napoleon said he loved so well was not advanced at all

To the warriors and to the statesmen of France and other nations the highest tribute of their fellows has been paid. But the real friends of the human race, the men who spend their lives within the laboratories, without battle flags or martial music, waging war against the unseen enemies of mankind, have, in comparison with soldiers, statesmen and kings, received scant reward either in the hearts or the monuments of the people

A thousand thousand times more valuable to mankind than all the warriors and emperors of time are the researches and the discoveries of Pasteur and countless other scientists before and From Pasteur's work has come asepsis and modern surgery, as well as the stimulation to new research "The whole world of disease," says Dr Pusey, "is now open to accurate study, and men have taken advantage of it with a zeal equal to that for the conquest of the surface of the earth which the discovery of aviation has aroused Where it will all end no one can foresee, but the results already gained are beyond Yellow fever, cholera, plague, typhoid fever, hook worm, malaria, are all within our capacity to control and most of them are already effectively controlled. We are witnessing now a unique spectacle in the history of civilization—the extinction of one of the world's most deadly diseases Within forty years yellow fever was endemic in many parts of the tropics and from these seats it spread in epidemics to other parts of the earth Its constant presence in Havana made it a menace to us each summer and required a cruel and costly quarantine to give us even partial protection now been driven entirely from the whole Western Hemisphere, its last refuge is a pest ridden, small part of the west coast of tropical Africa, where there seems every reason to believe it has made its last stand and will soon surrender Cholera, that as recently as 1893 scourged some of the best parts of northern Europe and has visited us repeatedly, is no longer a problem in civilized communities The bubonic plague the black death—that has spread over the earth in waves of pestilence, such as Defoe so vividly described in his Journal of the Plague Year, started recently on one of its death-dealing journeys around the world Occurring fifty years ago-or twenty-five years ago-this last epidemic would almost certainly have ravaged the United It crossed our borders, but was confined to a few flickering outbreaks on the coasts and these were snuffed out almost as soon as found Even as late as our Spanish-American War, through the stupidity of the military authorities, typhoid fever among our troops was the enemy

that we had to fight rather than the Spamards, it was the great Captain of Death One in seven of our soldiers had it. The military learned its lesson then, in the World War, typhoid fever was prevented-one in a thousand of our sol-The occurrence now of typhoid diers had it fever in any community is a disgrace to it Hook worm, that within ten years, made useless derehcts out of a large part of the population of great areas even of this fortunate country is, through the munificence of one of our great philanthropies, being eradicated " Diphtheria was once the great killer of children The toxins and the anti-toxins have struck a blow at this dread destroyer as dramatic and as effective as the advance of the American army through the Argonne.

Nor is the warfare of these scientists less thrilling if less sung than that of their fellows who, since the dawn of time, have answered to the command "Forward!" There are no finer heroes in our whole American story than Walter Reed and his colleagues who took on and conquered almost single-handed the scourge of yellow fever in the years following our war with Spain They were volunteers, some of them were private soldiers of the United States army They subjected themselves to the dangers of infection, some of them contracted the disease and suffering all its horrors terminated their heroic enterprise in death

But the war against disease is not over, it has only begun We know that the mosquito is the purveyor of yellow fever, yet we do not know the organism which he carries The army of the scientists is advancing on this enemy now Some of them, like the great Noguchi in the little town of Akkra on the west coast of tropical Africa, have laid down their lives in this new war There remain vast fields to conquer There are the degenerative diseases of old age. Despite the increase in the normal expectancy of life brought about by science within the past half century, no real key to the mastery of degenerative diseases. -the wear and tear upon the machinery of the body itself,-has yet been found There is the great domain of cancer, about which science as yet knows practically nothing. Insulin has come to us within the past decade dealing a bodyblow to diabetes That man or group of men who finally achieve the control of carcinoma and carcoma will deserve a monument higher and more lasting than that that marks the grave of any statesman, conqueror or king

The men like Pasteur, Lister, Walter Reed, Noguchi, Banting and their followers are the shock troops in this great warfare. The rank and file of the medical profession follow in their lead. The concentrated waves that follow up these new advances mop up what has been left behind, consolidate and hold the gains. The doc-

tor is or should be the purveyor to his patient of all the discoveries of the test tube and the laboratory,—of all the riches science has unearthed I say the doctor is or should be the purveyor of these things. Unhappily this is not always true.

"We are conscious," said ex-President Sadlier in his address at the last State Meeting of your Society, "that there is an ever-increasing recognition upon the part of the intelligent public that the art of preventive medicine has not kept pace with the known scientific advances and it is for the physician of the present and future to so conduct his activities as to bring preventive medicine to that increasingly high standard as an art that curative medicine now enjoys" Dr Sadlier then quoted these somewhat gloomy words of Dr William H Welch "When a Koch discovers the tubercle bacilli, a Banting discovers insulin for the relief of diabetes, or a Von Behring an antitoxin for the cure of diphtheria, or a Park demonstrates the value of the toxin-antitoxin for the prevention of diphtheria, the world draws a long breath as if saying to itself, 'Now we are rid of that terror which has haunted the human race for centuries' It then straightway forgets and goes on its way comfortably assuming that of course the great discovery, or invention, is being carried into effect. The actual facts are quite different A few people, those of unusual initiative, or ample means, or who happen to be under the care of exceptionally alert physicians, or within the jurisdiction of exceptionally competent health officers, receive the benefits of the new discoveries, but the great mass of the human race goes on as before, and the death rate from these diseases is reduced slowly and over long periods of time. In fact, the health field has a woefully ineffective distribution service, as compared with the laboratories of the world We know how to do a lot of things which we do not do, or do on a wretchedly small scale Few of the great discoveries of preventive medicine, except the prevention of yellow fever, are anywhere nearly fully applied" This discussion brings me a little closer to another branch of my topic.

The law relating to a physician's duty to his patient is clear and well settled. It lays down a reasonable and fair rule of conduct. So often in editorials, in addresses and in private conversations have I had occasion to state what this is, that it would seem here almost supererogation to repeat it, and yet this legal duty is one which cannot be too often restated or reaffirmed. Perhaps there is no more essential legal obligation resting upon the physician than that comprised within these words of our own Court of Appeals. "A physician and surgeon * * * is bound to keep abreast of the times, and a departure from approved methods in general use, if it injures the patient, will render him liable, however good his

intentions may have been * * * The law holds him liable for an injury to his patient resulting from want of the requisite knowledge and skill, or the omission to exercise reasonable care, or the failure to use his best judgment" Approved methods in general use! By these words the law takes notice of the progress of scientific discov-Whatever are the approved methods in general use at any particular time must be the methods which the doctor uses He fails to use them at his peril. A physician who in this year of grace were to employ the "approved methods in general use" in say the year 1878 would, it is safe to say, be guilty of malpractice in 70% of the cases which he treated. The theory and the practice of asepsis a half a century ago if now employed in operative procedure would be regarded almost as barbarism "The approved methods in general use" by our grandfathers and great-grandfathers were the best that science had But these methods up to that time devised change in proportion to the unprecedented advance in discovery and experimentation

The lay public now is better generally educated than it was fifty years ago Even the layman is not unacquainted with scientific progress Such books as "The Story of Science" and "Microbe Hunters" and many other similar works, as well as the lav press and the magazine, have acquainted the man in the street, at least in a rudimentary way, with some of the major points of scientific The result is that the layman increasingly expects his doctor to give him the benefits at least of those new discoveries whose worth has been scientifically established The layman knows now the purpose, the value and the need, for example, of X-rays in fracture work some knowledge of the symptoms of appendicatis He has heard about the toxins and the antitox-Many of the physicians' cases which I have had to defend have arisen from the fact that the doctor did not use the "approved methods in general use" In some instances the failure to employ such methods has been so mexcusable that I have found it necessary, with the physician's consent and approval, to make a settle-This applies in every branch of medicine I remember one instance in obstetrics where the question involved was as to the nature of the method used The physician was an old man In preparing the case I asked him what authority he followed He mentioned some well known work, but when I asked him what edition he was using, he said the one he had studied in medical school,-he graduated in the early eighties The case was settled

There is then a definite legal obligation resting upon every physician to "keep abreast of the times" and to employ only "those methods in general use" He cannot employ those methods if he does not keep abreast of the times But the

. /

law is reasonable. It imposes a less severe obligation than that which the physician should impose upon himself The law says that he must not depart "from approved methods in general use," but if the medical profession as a whole does not promptly adopt and generally use the proven discoveries of science, the individual physician is not legally responsible for not using The law in the last analysis imposes a rather low standard of duty If the discoveries of science are not "in general use," an individual physician is not liable for not using them standard then is set by the medical profession, not by the lay public or the courts The standard is as high or as low as the medical profession itself makes it. It behooves then the practitioners of the healing art and especially you leaders of the profession, to see to it that as rapidly as new methods have been scientifically established, they should become of "general use."

From other aspects of the legal rules concerning the physician's duty it is revealed how liberal and fair is the judicial concept of this obligation It does not demand that the individual practitioner shall be an exceptional man, it only requires him to have the average attainments "A physician and surgeon," says our highest court, "by taking charge of a case, impliedly represents that he possesses, and the law places upon him the duty of possessing, that reasonable degree of learning and skill that is ordinarily possessed by physicians and surgeons in the locality where he practices, and which is ordinarily regarded by those conversant with the employment as necessary to qualify him to engage in the business of practicing medicine and surgery * * * The rule in relation to learning and skill does not require the surgeon to possess that extraordinary learning and skill which belong only to a few men of rare endowments, but such as is possessed by the average member of the medical profession in good standing" No physician who is competent to practice his profession should find it difficult to meet this not too exacting requirement. Here again his standard of duty is a professional standard of his own brethren, rather than some standard which the layman may impose He is required only to have that skill and learning possessed by the "average" member of his protession, and even this requirement is qualified because the rule says that his skill and learning need be only such as is "ordinarily possessed by physicians and surgeons in the locality where he practices" How high or how low this degree of learning and skill may be, depends upon the medical profession itself. If in any locality the standard is low, the individual physician is legally obligated only to comply with that standard What the standard is is within the hands of the medical profession of his "locality" should be understood that while he is required only to possess that learning and skill ordinarily possessed by the surgeons in his locality, the methods which he employs must be those "in general use," irrespective of whether or not the physicians of his locality may have failed to employ those "approved methods"

No physician worthy of the honored title "doctor," no physician fit to have a patient, will be content with the minimum requirements of the legal rule of duty, any more than a conscientious man of affairs would be satisfied to conduct his business in such a way as to just barely escape the clutches of the criminal law No physician will be satisfied to continue merely as "an average member" of his profession. He will seek to attain a far higher standard of learning, skill and competency and to give to his patient, insofar as he can, all of the discoveries which recent science has placed at his disposal. And yet in this connection a note of warning should be uttered No physician is justified in using any new procedure or method despite his own belief in its merit, unless it has been scientifically demonstrated to be of value. No matter what his motives, he may not experiment with his patient. Indeed, were he to adopt a new procedure not thoroughly accepted or, as the law says "in general use, he would do so at his peril. Thus, while the physician must keep abreast of the times in his individual practice, he has no right to go ahead of His standard is the standard of the the times medical profession in vogue at the time of his treatment It is difficult then for the individual physician to blaze out new trails, at least insofar as his treatment of an individual patient is concerned He is a member of an army, he cannot lag behind, neither can he be too far in The duty to advance then rests upon the whole army, not upon any individual

The problem of the physician is a difficult one. No two cases are exactly alike Judgment must always be brought into play Yet no physician who keeps abreast of the times and who uses his best judgment need have cause to fear The law says that he is under the obligation "to use his best judgment in exercising his skill and applying his knowledge" It is not the judgment of some other man that he must use, but "HIS" best judgment But the law in this as in other things, takes a rational and common-sense point of view, because it says that this rule does not hold the physician "liable for a mere error of judgment, provided he does what he thinks is best after careful examination" Furthermore, recognizing the fact that some diseases do not yield to treatment no matter what the treatment 1s, and that some men must die no matter what is done for them, the law says that the physician is not held to "guarantee a good result," but he merely promises "by implication to use the skill and learning of the average physician, to exercise reason1304 LEGAL

able care and to exert his best judgment in the effort to bring about a good result"

It is sometimes said by physicians that all malpractice suits are blackmail. This is not correct Many cases would appear to have features of this kind, but not all. Some of the malpractice suits are cases with real merit. Cases of this kind are settled, thereby doing justice both to the physician and the patient. Those of the physicians who have taken advantage of the excellent provisions of our group insurance plan in such instances breathe a deep sigh of relief with realization that the settlements, where they are necessary, are paid for by the insurance carrier and not by them

So much for the specific application of the law to the physician But the title of this paper suggests implications more far-reaching than

those already discussed

This is a government of laws and not of men Our laws are made by the people through their representatives in the legislatures These laws and the individual rights and duties of all citizens, including doctors, are administered and construed by the courts Our laws are in the hands of the people They choose their legislators and they elect or provide for the appointment of their Every citizen has a direct, personal interest in the law and in its administration. There is no class of men to whom this should be more interesting or important than the members of the medical profession Every doctor is a man of influence in his community. He has a right and he owes the duty to assist in seeing to it that fit men are nominated and elected to office, and that adequate laws are passed and improper legislation is prevented. From time to time organized medicine has exhibited a great influence in this state Its notable achievement was the enactment of the present Medical Practice Act and its assistance in preventing the licensing of chiropractors and other charlatans, fakers and unfit men

The doctor should not only keep abreast of the times with respect to his chosen calling, but in general he should be alert to all that is going on The great problems of public health are now coming rapidly to the fore. The physician should take the position of leadership. If he is too absorbed with his own private affairs, he will find that that leadership has been taken from him. "In developing the art of preventive medicine," said Dr. Sadher in his paper previously quoted, "we must ever recognize the duty and responsibility of the medical man to assume the initiative and to lead along correct lines of procedure which

will insure unity of action and harmonious agreement between the various agencies which work, and should cooperate, in this field of endeavor Medical men have been so preoccupied with curative medicine that they have failed in many instances to take over this newer activity and hence lay organizations have appropriated the field and often indeed with the consent of the physicians Every physician must concede the vital need of lay organizations in public health work * * * But in accepting the assistance of lay agencies we should be ever mindful of the fact that by reason of his particular type of education the physician is basically trained to be the leader in such health work, and in those communities where we find the physicians exercising a gentle and friendly leadership over lay organizations and directing the health activities of their community we note a more advanced public health condition and better progress in preventive medicine * * * Individual physicians and organized medical bodies should recognize the close relationship existing between our activities and those of our State Department of Health with its ramifications into the various counties and its working force consisting largely of medical men, mostly members of our State Medical Society, who, in their capacity as health officers, are responsible for the public health in their community, in so far as applies to communicable disease * * * there should be a very close alliance between the Department of Health and the County Medical Society"

Every physician then has a direct, personal interest in and contact with the law. He has the opportunity and the duty to assist in devising scientific legislation and to prevent the passage of unwise or unjust enactments There should be a closer understanding between the doctor and the lawyer Each in his own way should be a leader for all that is good in his community Into the ranks of these professions no one should come who is not in sympathy with their ideals and sincerely willing and eager to uphold them Unfit doctors and lawyers bring discredit not only upon themselves, but upon their high call-Despite the recent disclosures which have revealed in New York City at least, the existence of many objectionable practices on the part of both lawyers and doctors, it is believed that the rank and file of both professions may be looked to now as of old as the faithful servants of their communities, of their day and generation, the pillars of your government and the leaders of true

progress

NEWS NOTES

THIRD DISTRICT BRANCH

The Twenty-second Annual Meeting of the Third District Branch of the Medical Society of the State of New York was held on October 4 in the Columbia County Club House, between Hudson and Philmont, with the President, Dr E A Vandeer Veer in the chair and the Secretary, Dr William Rapp, recording

About 150 members were present out of a total

membership of 518 of the entire district

The day was perfect, and the arrangements for the meeting were well perfected and carried out The meeting was held in three sessions

1 A morning scientific session

2 A social clam bake on the veranda of the Club House, through the courtesy of the Columbia County Medical Society

3 After-dinner addresses by State officers on

the work of the State Society

The first scientific paper was on the "Medical Inspection of Schools," by Dr Lewis Van Hoesen of Hudson, who brought out the objects of medical inspections. He spoke of the difficulties of making the inspections, especially those of following up these children, and of securing the correction of their diseases. He also spoke of the indifference of school authorities to the spirit of the law and their frequent adoption of minimum standards of legal requirements.

The paper was discussed by Dr Franklin Barrows, Assistant Medical Inspector of the State Department of Education, who pointed out some of the ways in which physicians could improve their medical inspections. He suggested that if a physician's only interest in making inspections is the money which he gets, then the inspections

will always be poor

Other speakers brought out the failure of physical trainers to cooperate with the physicians in the correction of physical defects, especially those of the feet, which are readily susceptible to improvement by proper exercise. From the point of view of the physicians and of the educational authorities, the work of physical training is not the turning out of "winning teams" in foot ball and basket ball but to correct physical defects of the children and to conduct exercises for the correction of physical defects and the development of strong bodies among all the children and not merely a few athletes

The second number on the program was "Undulant Fever," by Dr Charles M Carpenter, formerly of Ithaca, but now of the Albany Medical College Dr Carpenter said that while undulant fever was often ascribed to the bacilli of malta fever, it was actually a different disease. He

discussed the diagnosis of the sickness, and the value of a serum which has been developed by the Mulford Laboratories

Doctor Steuart B Blakeley, of Binghamton, discussed the causitive factors in maternal mortality and the methods of preventing disease from child birth Doctor Blakeley emphasized the need of educating prospective mothers to consult their doctors during the pre-natal period speakers during the discussion gave instances of the "red tape" administration of the regulations of the State Department of Health regarding puerperal diseases and deaths The explanation of the misunderstandings and dissatisfaction seemed to be that several divisions handled the The field work of investigating cases is handled wisely by the Division of Communicable Diseases, and afterwards the Division of Nursing reports on the conditions, and the Division of Vital Statistics sends out form letters and blanks which are sometimes irritating and If the Division of Comeven threatening municable Diseases were the only division that investigates the diseases, the doctors would cooperate with the Department freely and gladly

A study of the causes of deaths following gall bladder operations was presented by Dr E MacD Stanton of Schenectady, and was discussed by Dr George F Chandler of Kingston It is expected that the paper and the discussion will be published in an early issue of this JOURNAL

The after-dinner speeches were made by officers of the State Society Dr Harry R. Trick, President, described the benefit which the State Society brought to the individual members, and the deepening interest which the physicians were showing in the State activities of the State Societies

Dr D S Dougherty, Secretary, referred to the present attendance of thirty per cent of the members of the Third District Branch as evidence of the interest which physicians are taking in medical society affairs

Dr James E Sadlier, Past-President and Chairman of the Committee on Public Relations asked the doctors to assume the leadership in public health work, and as an example of what they can do, he yielded the greater part of his time to Dr W H Ross of Brentwood, a Trustee of the State Society and a leader in public health work in Suffolk County

Doctor Ross said that the Medical Societies of the counties and the State worked along two lines

1 Scientific medicine, and

2 The newer duties which doctors owe to the public.

Doctor Ross said that when the Public Relations Committee was formed in 1926, its attitude was to "assist" lay agencies in public health work The present attitude was frequently stated by Doctor Sadlier to be that doctors should assume such a leadership The difficulty is that physicians generally do not know how to assume that leadership, for it is a new conception, and the methods of its practice are still in the process of evolution and development Yet there is a solid foundation of experience on which to build a system of leadership The Stote Society has over one hundred officers and committeemen listed in its Directory, the District Bronches have 50 officers. while 300 physicians are officers of county medical societies Add to these the 800 local health officers in New York State, and there are over 1,000 physicians trained to leadership in the fields of public health, civic medicine, and preventive work Ten per cent of the members of the State Society are therefore potential leaders whom the other 90 per cent will follow, providing plans of work are developed along practical lines

Doctor Ross called attention to the fact that the New York State Journal of Medicine carried a considerable number of reports of the activities of county societies in some line of public health endeavor. The doctor said that out of 46 articles

indexed in the October first issue of the Journal, 15 were on the civic duties which the medical profession owe to the public. He had asked one physician how many such articles were in the Journal, and the reply was, "Possibly five or six" Dr Ross urged the physicians to read the news items in the Journal and the department called "Our Neighbors" to see how the medical profession of New York State was discharging its civic duties

Doctor Ross closed by describing the civic activities of the Suffolk County Medical Society in securing the establishment of a County Department of Health While other organizations in the County had cooperated and approved the plan, yet the leadership from beginning to end of the two-year campaign was in the hands of the physicians, and no one else (See this JOURNAL, September 15, page 1127)

Dr John A Card described the plan of indemnity insurance adopted by the State Medical Society (See this JOURNAL, Oct 15, page 1244)

The meeting of the Third District Branch, like that of the other branches which have been held this fall, was eminently inspiring and well calculated to arouse and maintain the interest of the members in regard to the duties which they owe to the people

THE FIFTH DISTRICT BRANCH

The Fifth District Branch of the Medical Society of the State of New York held its Twenty-second Annual Meeting on Tuesday, October 9, 1928, in the Hotel Utica, at Ithaca, New York, with Dr Paige E Thornhill, President of the Branch, in the Chair Ninety-four members were registered for the morning session out of a total of 748 members for the District

The program of the morning was on scientific topics. A luncheon was served at 12 30 by the Oneida County Medical Society. After-dinner addresses were made by officers of the State Society, and the scientific session was resumed in the afternoon.

The first speaker on the scientific program was Dr James E McAskill, of Watertown, whose subject was "Ear Infections in Children"

He said that statistics from some clinics showed that about seventy-five per cent of gastro-intestinal troubles in infants were due to infections in the ears or nasal sinuses. And other speakers seemed to agree that the proportion of cases having these complications was very high

In typical cases of middle ear trouble, the infectious material drains externally, and so does not produce systemic infection. But there are a considerable number of atypical cases in which the drainage is through the Eustachian tube and the infectious material is retained in the body

These are the cases which produce vague symptoms of gastro-intestinal disturbances. The diagnosis depends largely on systemic and focal reactions in other parts of the body, and to a less extent on local manifestations in the ear

The doctor's paper elicited considerable discussion, and all agreed that the relation of ear troubles to upset stomachs in children should be brought forcefully to the attention of general practitioners of medicine

The second paper was on the "Standards of Pre-Natal Care" as prepared by the National Joint Committee on Maternal Welfare This subject was presented by Dr James A Harrar, of the Lying-in Hospital, New York City The National Committee issues leaflets intended as guides for making pre-natal examinations These leaflets are valuable to general practitioners The speaker emphasized the fact that family doctors were capable of making pre-natal examinations and urged that they do so

Dr Harrar's paper was discussed by several general practitioners who had studied the leaflet for a couple of months, and all agreed that the outline was a perfectly practical one to follow

Dr Howard Fox, of New York City, spoke on the "Diagnosis and Treatment of Common Skin Diseases' and illustrated his remarks with lantern slides of cases Dr Fox discussed a considerable number of common diseases, and described the treatment of each of those, making his paper prac-

tical as well as interesting

The after-dinner speaking was by Drs Trick, Sadlier, Card, and Ross, who described the work of the State Medical Society and the unification of the State's program through the county societies. All the speakers emphasized the fact that the county society was the unit in which the details of the work of the State Society were carried out. In fact, one of the great objects of the State Society is to promote the activities of the County Societies and the individual members. The speakers offered the services of the State Society to the local leaders in the organization of their

work, and for inspiring and instructing them in their programs and activities

The first speaker in the afternoon session was Dr L Whittington Gorham, of Albany, who spoke on the "Liver Treatment of Pernicious Anemia" He said that relapse was likely to occur unless the liver treatment was continued

The last speaker of the afternoon was Dr Harry E Burdick, of Syracuse, who spoke on the "Non-Surgical Treatment of Abortions," especially emphasizing the avoidance of curettage because of the danger of spreading the infections

The program of the Utica meeting was intensely practical, and well adapted to an audience of general practitioners

THE EIGHTH DISTRICT BRANCH

The twenty-third annual meeting of the Eighth District Branch was held at the Buffalo City Hospital on October 2, 1928 There was a large attendance. The clinics, held from eleven to one o'clock, showed that the medical profession is appreciative of this form of teaching. The laboratory demonstrations and group clinics were held as follows.

Pathology, including Post Mortem William F

Jacobs, M.D., Buffalo

Metabolism and Chemistry Alvin G Foord, MD, Buffalo

X-ray Clifford R. Orr, M.D., Buffalo

Psychiatric Clinic Herman G Matzinger, M D, Buffalo

Transfusions Francis D Leopold, MD,

Buffalo

Goitre Clinic Alfred H Noehren, M D, Buffalo, and associates

A cafeteria lunch was served at one pm in the

auditorium of the City Hospital

The afternoon session was called to order at

two pm with the President, Dr Thomas J Walsh in the chair

The first address was by Dr Harry R Trick, President of the Medical Society of the State of New York, who spoke on Organized Medicine at Work He discussed the past, present and future problems of the State Society

Dr James E Sadlier, of Poughkeepsie, discussed the work of the Public Relations Committee Dr John H Card, of Poughkeepsie, spoke on Group Insurance and showed why the rate was slightly increased in the Aetna Company this

year

Dr William D Johnson, of Batavia, spoke in his inimitable way on "Evolution in Medicine" Dr J Henry Dowd, of Buffalo, gave an interesting paper on the "Coming Generation" Dr Charles B Handel, of Buffalo, discussed

Dr Charles B Handel, of Buffalo, discussed "Modern Plastic Operations for Correction of Deformities of the Nose and Face" and illustrat-

ed his talk with motion pictures

W WARREN BRITT

THE FIRST DISTRICT BRANCH

The 22nd Annual Meeting of the First District Branch was held on Thursday, October 18th, 1928, in the Briarchiff Lodge, Briarchiff Manor, Westchester County

The members gathered at the Hotel in the late morning and enjoyed the beautiful scenery from the verandas and parlors. The day was perfect and the views across the golf links and to the

Hudson River were splendid

A business session was held in the morning, at which the subordinate officers were advanced, the First Vice-President, Dr George B Stanwix of Yonkers being the President, Dr Charles D Kline of Nyack, First Vice-President, Dr I J Landsman of the Bronx, Secretary Dr C

Knight Deyo of Poughkeepsie was elected Third Vice-President.

The delegates present enjoyed a social luncheon at noon in the Hotel dining room. After luncheon a scientific session was held, which was attended by about fifty members. The numbers on the program were largely illustrated with lantern slides, and were particularly interesting and practical.

The complete scientific program was as follows Diagnosis of Oesophageal Lesions, with Lantern Slides, Pol Coryllos, M.D., New York City

Painful Scars and Their Treatment, Frederic W Bancroft, M D, New York City

Diagnosis and Treatment of Infections of the

Hand (Motion Picture), Henry W Cave, MD, New York City

Serum Treatment of Pneumonia, with Lantern Slides, Henry T Chickering, M.D., New York City

Oxygen Tent Therapy in Pneumonia, with Lantern Slides, Alvin L Barach, M.D., New York City

The State officers were present and discussed

affairs of the State Society

Dr Harry R Trick, President, spoke of the benefits which the State Society afforded to the members, especially in the way of graduate education

Dr James E Sadlier, Past-President, and now Chairman of the Committee on Public Relations, described the practice of civic medicine by the various county societies

Dr John A Card, Speaker of the House of Delegates, and Chairman of the Committee on Group Insurance, appealed to the doctors to uphold the insurance plan which had been adopted by the State Medical Society, and he especially warned the doctors against offers of insurance companies who are not legally qualified to maintain offices in New York State but have to depend on advertising and mail orders to secure patrons and do business

THE PRACTICE OF DIPHTHERIA IMMUNIZATION IN NEW YORK CITY

A conference of representatives of the medical societies of the five counties of Greater New York, and the Department of Health of New York City, was held in February, 1927, for the purpose of discussing means for promoting the practice of diphtheria immunization by family doctors. One result of the conference was the preparation of a four-page pamphlet entitled "The practice of diphtheria immunization as recommended by the five County Medical Societies of the City of New York"

The first page of the pamphlet carries the statement "The Five County Medical Societies, the Health Department and other organizations interested in the public health are undertaking an intensive compaign to eliminate diphtheria in our

City"

The pamphlet also bears the statement "This leaflet is printed through the courtesy of the Brooklyn, the New York and the Queensboro Tuberculosis and Health Associations"

The pamphlet, a second edition of which has recently been issued, was written for the benefit of the practising physicians of the City and was as follows

Diptheria

"Modern diphtheria prevention has acquired a weapon which has already proven powerful and effective in the battle against this disease

"This is toxin-antitoxin, which enables us to immunize and to protect all susceptible persons

"The control of the disease is in our hands Let us not delay in adopting this method of proven value It is simple, easily applied and without danger. The greatest obstruction today to diphtheria elimination is the delay in using this means of prevention

Toxin-Antitoxin

"Toxin-antitoxin is a mixture of diphtheria toxin and diphtheria antitoxin. The composition is such that the toxin present produces no harm-

ful effects on the body and yet is effective in producing immunity to the disease

"Toxin-antitoxin is a clear, transparent fluid A good preparation is never cloudy. The mixture is stable for at least six months and during that time does not deteriorate, if properly kept in a cool place. It has been found that the amount sufficient to produce immunity is three doses of 1 c.cm each, given at intervals, using the standard preparation on the market originated by the Health Department of the City of New York. Toxin-antitoxin is obtainable from the Health Department of the City of New York.

Dosage

"1 c cm of the mixture is the dose given at each injection for all ages

Interval Between Injections

"Not less than seven nor more than fourteen days The simplest procedure is to have the patient report on the same day of the week for three consecutive weeks

Technique of Injection

"Like an ordinary hypodermic—Sterilize the syringe and needle, fill with 1 ccm of toxinantitoxin, prepare the skin at site of injection (as the deltoid region of the arm, the upper gluteal region), and give the injection preferably subcutaneously

Reactions

"In many cases there are no reactions, either local or general In susceptibles a local reaction characterized by redness and a certain degree of tenderness and a little swelling may appear at the site of injection This reaches its height in two or three days and gradually subsides

"General reaction rarely appears in young children In older children malaise and slight fever may be seen Permanent harmful effects are never observed after the use of toxin-antitoxin

Period Required for Immunity to Develop

"The immunity begins to develop a few weeks after the third injection but requires from three to six months to reach its height in all immunized persons. The immunity has been shown to last for two years and in all probability remains for life.

Immunization Procedure

"Give toxin-antitoxin to all children under ten years of age without doing a Schick test

'In children over ten years one may do a Schick test and then give toxin-antitoxin to all those found to be susceptible. But even here a Schick test is not imperative.

"Irrespective of the history of previous immunizations or clinical diphtheria, a positive Scrick test indicates that the individual needs toxin-antitoxin

Susceptibility to Diphtheria

"Up to six months of age 80 per cent of infants are immune. This immunity is conferred upon the child by the mother

"From nine months to three years, practically all children are susceptible Give Every Child Toxin-Antitoxin

"From three to ten years, about half of all chil-

dren are susceptible Every Child Should Be

"From ten to fifteen years, less than one-quarter of the children are susceptible. For this age group it is advisable to give the Schick test to detect susceptibility, but toxin-antitoxin may be given without a Schick test.

Schick Test

"One can determine whether or not the toxinantitoxin injections have conferred immunity on the children by making a Schick test five or six months later

'Physicians who desire to have a Schick test made by the Department of Health can refer the children to one of the special Schick clinics maintained by the Department. In all such cases a report giving the result of the test will be sent directly to the attending physician

Diphtheria

"In any case where a suspicion of diptheria ex-

ists antitoxin should be given"

Since the physicians of New York City are in full accord with Commissioner Wynne in his anti-diphtheria plans, the coming winter will doubtless see a record number of diphtheria immunizations done in the City

QUEENS COUNTY

A stated meeting of the Medical Society of the County of Queens was held at the Oakland Golf Club, Bayside, on Tuesday, September 25th, 1928, at 8 30 P M, following the Ninth Annual Informal Dinner of the Queensboro Tuberculosis and Health Association, President F G Riley, M D, in the chair

In the Executive Session the report of the Censors was received recommending for election to active membership the following Clarence J Cohen, M D, 7th Avenue and 11th Street, Whitestone, C H Ellard, Jr, M D, Storm Street, Bayside, Martin W Jurkowitz, M D, 9-43 122nd Street, College Point, Henry D Niles, M D, 23 Victor Avenue, Elmhurst

They were duly elected by ballot cast by the Secretary The following transfer was announced

I L Nascher, M D, 3507 90th Street, Jackson Heights, by transfer from the Medical Society of the County of New York, under date of September 22nd, 1927

The following statement was made by Dr Edward J Buxbaum, Chairman of the Committee on Public Health and Public Relations

"It is reported that the Board of Education is considering the adoption of a regulation requiring all children entering school for the first time to furnish a record of their physical condition. If

such a regulation is adopted and adhered to it would tend to educate the oncoming generation as to the value and need of periodic health examinations. It would also no doubt stimulate many parents of children now hampered in their school progress by correctable physical defects to secure medical care for such children.

"The Board of Education would not be warranted in adopting such a regulation without assurance that every child can secure a physical examination at a cost within its means. Many children of poor parents can pay little or nothing for such an examination. These children must be examined either by family physicians at little charge or by physicians employed by the city.

"If the latter procedure were adopted it would mean placing upon the City payroll a large number of additional physicians who would hold examining clinics in the school buildings or elsewhere. Such a program would tend toward State Medicine—If this method of examination were adopted and became an accepted procedure it might be extended from time to time to other fields

"Family physicians are qualified and prepared to do such work. We should not give ground for the city or the public to charge us with being unsympathetic to such protective measures. Most parents would prefer to have their children examined by their family physician. The more we cooperate in health measures the greater will be the confidence of the public in our efforts and the more they will turn to us for advice in all health and sickness needs. It would be well for us to indicate our cooperation and support by an appropriate resolution urging the cooperation of all physicians in this important matter."

Thereupon Dr Buxbaum moved the adoption of the following resolution

WHEREAS All children entering school should have a physical examination for the purpose of discovering any physical defects which, if not corrected, might retard them in their school work, and

Whereas Such examinations can be most efficiently and conveniently performed by family physicians, and

WHEREAS The Physicians of Queens Borough heartily approve of such precautionary work and desire to further it as far as practicable

Therefore Be It Resolved That this Society urge all its member physicians to examine all entering school children applying to them for an examination, at a fee each can afford to pay, and refuse none because of inability to pay, and

Be It Further Resolved That the Secretary be and hereby is directed to advise the Secretary of each of the other County Medical Societies of the City of the passage of this resolution by this Society and urge its consideration by their Societies favorably, and

Be It Further Resolved That the Secretary be and hereby is directed to notify the President of the Board of Education of the passage of this resolution and its transmissal to the other Medical Societies of the City, and to urge the adoption of the regulation mentioned by the Board of Education to take effect as of January, 1, 1929

The resolution having been duly seconded was unanimously passed by the Society and the chair directed the Secretary to make the notifications indicated in the resolution

Scientific Session

WASHINGTON COUNTY

The annual meeting of the Medical Society of the County of Washington was held in Hudson Falls October 3, 1928, at 4 o'clock, with Vice-President Bennett in the chair Members present Drs Cuthbert, Stillman, Pashley, McArthur, Paris, Bennett, Banker, LaGrange, Park, Casey, Prescott and Oatman, visitors, Roy E Borrowman, Samuel Pashley, Elliott, Bowen, Jensen, Dr Joseph S Lawrence, Executive Officer, and Dr Harry R Trick, President of the State

The President appointed Drs Stillman, Cuthbert and MacArthur as nominating committee and the following were nominated and duly elected officers President, W S Bennett, Vice-President, R E LaGrange, Secretary, S J Banker, Treasurer, R C Paris, Censors, B C Tillotson, L M White and J E Armstrong, Committee on Legislation, W A Leonard, B M Vickers, and D F MacArthur

The name of Dr Roy E Borrowman was presented for membership and he was duly elected

A resolution was adopted "That we go on record as approving the resolution of the State

Sanitary Association regarding the special automobile license for physicians' cars''

After much discussion of the subject the fol-

lowing resolution was adopted

WHEREAS, the members of this society have had difficulty in collecting their bills for caring for injured employees insured under the State Insurance fund.

Therefore be it resolved, that we protest against the business methods of the State Insurance Fund, and unless said State Insurance Fund is more prompt in meeting its obligations, the members feel that they will be obliged to demand a guarantee from the employer

And be it further resolved, that a copy of this resolution be transmitted to the State Insurance

Dr Cuthbert gave a very instructive talk illustrated by the x-ray of cases of fracture at or near the elbow joint

The Society took a recess for dinner Dr LaGrange, President pro tem, presided at

the after dinner session
Dr Harry R Trick, President of the Medical

are it among

Society of the State of New York, gave a very interesting address on what had been accomplished by organized medicine in this state, especially for the public, and also as an advance toward more efficient work for the profession

Dr Joseph S Lawrence spoke at length on the subject of maternal mortality, giving the statistics on that subject. This subject was discussed by nearly every member of the society and by Dr Elliott of Glens Falls

Dr W C Jensen, Superintendent of the Warren County Tuberculosis Sanatorium, spoke on the subject of "The Tuberculosis Problem for Rural Communities" He thought that Washington County was very well provided for with the exception that it had no Sanatorium He urged the physicians to assume the leadership in conducting clinics for the delection of cases

Adjournment

S J Banker, Secretary

CHAUTAUQUA COUNTY

The regular fall meeting of the Medical Society of the County of Chautauqua was held on October 3, 1928, at the Newton Memorial Hospital at Cassadaga, N Y, with Dr Walter D Rathbun, Superintendent, as host

Dinner was served at 1 P M with about 40 members in attendance At the business meeting preceding the dinner the Society voted to petition the Board of Supervisors to establish a County Department of Health in our County

Scientific Session followed the dinner with the following program

Correlation of Clinical and Pathological Find-

ings in Chronic Pulmonary Tuberculosis, Dr Harry A Bray, Raybrook

Treatment of Pulmonary Tuberculosis by Artificial Pneumothorax with Exhibition and Demonstration of Technique, Dr R. F Zimmerman, Newton Hospital

Juvenile Tuberculosis, Its Significance and Relation to the Control of Tuberculosis, Dr Walter D Rathbun, of the County Hospital

After the meeting the new Children's Building which is to be formally opened on the 7th of October, was inspected by the members of the Society

Edgar Bieber, Secretary

MONROE COUNTY

A meeting of the Medical Society of Monroe County was held on the evening of October 16, in Rochester The subject of the meeting was the purity of the water supplies of the county, especially that of Rochester The City takes it water from Lake Ontario which is subject to sewage pollution from the Genesee River The point under discussion was the adequacy of the sewage disposal plants of Rochester Dr C M McCay, Assistant Professor at the Animal Nutrition Laboratory of Cornell University led in criticizing the disposal plants, while the sewage systems were

defended by Stanhope Bayne-Jones, Professor of Bacteriology in the Rochester Medical School, Dr George W Goler, City Health Officer, and Mr Harold O Baker, Commissioner of Public Works The three defenders of the City authorities demonstrated their familiarity with all phases of sewage disposal and showed that they had plans adequate for dealing with the sewage for years to come The Society commended the sanitary authorities for their active interest in the sewage and water problems of the City of Rochester

J M HENRY, Secretary

THREE GENERATIONS OF PHYSICIANS

Dr Elizabeth I Adamson of New York City is the daughter and granddaughter of physicians Her grandfather, Dr M F Adamson, was a practicing physician for sixty years in Maryville,

Kentucky Her father, H K Adamson, graduated from Bellevue Hospital Medical College and lived in Maryville where he practiced general medicine until his death in 1912

MEDICAL WARES

COD LIVER OIL

Cod liver oil is one of the oldest of all the standard remedies in present use. It was known to the ancient Vikings, and their country is still its greatest producer. Norway supplies about 80,000 barrels of the oil in a normal year, with Newfoundland the second largest, but yet a much smaller producer.

The peculiar virtue of cod liver oil is that it contains enormous quantities of vitamines A and D. Vitamine A is the growth-promoting and resistance-building factor, while vitamine D, or the anti-rachitic vitamin, promotes the building of bone and teeth by its influence on the metabolism of calcium salts. Both vitamines A and D are of great importance to life and health and in the complete absence of either one death occurs.

The vitamin-bearing fat in a codfish lies entirely in its liver, which represents about five per cent of the weight of the fish. Thirty to fifty per cent of the liver consists of oil, the proportion varying in different seasons and years. The methods of preparing and standardizing the oil have been perfected within a decade, and today the potency of the vitamines of oil is known and guaranteeed by reliable makers.

The former methods of extracting the oil were crude, and much of the product was low in vita-The original method was that the livers were thrown into a barrel and left to de-The exposure incident compose in the sunlight to the process of decomposition destroyed much of its vitamines The process of rendering by heat in the presence of air subjected the vitamines to oxidation which also destroyed their po-The modern method followed by one manufacturer is that of extracting the oil by heat in an atmosphere of carbon dioxide The principle of keeping the oil free from oxygen by its saturation with carbon dioxide is observed through the entire course of its manufacture and The barrels in which the oil is transported, the tanks in which it is stored, and the bottles in which it is finally sold to retail customers all contain an excess of carbon dioxide

Cod liver oil, like other animal oils, consists of a mixture of olein and stearine. The stearine solidifies at the temperature of an ordinary ice box, and causes a bottle of the crude oil to become cloudy. The oil is therefore refined by the removal of the stearine, which is accomplished by cooling it to a point at which the stearine solidifies while the olein remains liquid, and then separating the two fats by pressure. The stearine is as potent as the purified oil, and the only

objections to it are the appearance of the oil and also its taste, as the presence of stearing increases the viscosity of the oil, thereby making it less satisfactory to the taste

A great deal of cod liver oil is used in animal husbandry. The stearine and the oil of lower grades finds a ready sale for feeding poultry and other farm animals. Much oil of the lower grades, so far as appearance is concerned, is produced owing to such conditions as storms at sea delaying the delivery of the livers to the rendering plants, but all grades find a market owing to the greatly increased demand for the oil in recent years following the demonstration of the potency of its vitamines.

Reliable firms test the potency of their cod liver oil by feeding it to growing white rats. A sample from a shipment of oil is sent to a biological laboratory for feeding tests, and a period of six weeks, or the growing time of a young rat, must elapse before the result of the test is known and the oil released for the market. Few physicians are aware of the great amount of scientific research of the highest class that is maintained by manufacturers of medical wares, or of the great public health value of those researches and tests

The removal of the fishy taste of cod liver oil has been the object of much study. A mint flavor added to the oil has been found most effective for masking the taste, and does not effect the potency of the vitamines.

The most common means for eliminating the objection some patients have to taking oil is that of emulsifying the oil. But the processes of emulsification often introduce the element of oxidation which is likely to occur from the agitation with water during its manufacture. Also the shaking of the bottle when it is administered adds more oxygen with a reduction of the potency of the vitamines. The usual emulsions require a dose not merely double that of the pure oil, but often four times that in order to equal the vitamin potency of good oil

Manufacturers are conducting expensive researches in order to discover and isolate the active vitamines of cod liver oil. The artificial activation of the oil by rays of light has been discarded, because the light destroys the vitamines. Cod liver oil remains by far the most potent source of vitamines A and D, and there is no prospect that it will be displaced in the near future. The medical demand at present is for the natural oil, owing to the standardization and permanence of its vitamine value.

THE DAILY PRESS

TYPHOID IN NEW YORK CITY

The New York Herald-Tribune of October 7 describes an outbreak of twenty-three cases of typhoid in the vicinity of Washington Square—the Greenwich Village section of the City Dr Shirley W Wynne, Commissioner of Health is quoted as saying

"As soon as we discovered numerous cases of typhoid in the section between Bank and Eleventh Streets we suspected a 'carrier' lived there. We traced most of the patients as having been customers of the candy store and there we found Morsch, who was recognized as a carrier held responsible for fifty-nine cases in Brooklyn in 1914."

The account continues "Morsch, according to health officials, was out of work as a plumber and

went to live with relatives in Bleecker Street The relatives kept a candy store on the ground floor and the plumber served ice cream cones and candy to children The children and others who were afflicted were said to be those who visited the candy store frequently

"As soon as the outbreak of typhoid in Greenwich Village was traced to him, Morsch was removed to Riverside Hospital, where he was isolated along with the famous "Typhoid Mary" Mallon, who since 1903 has been held responsible for seven epidemics. Like "Typhoid Mary," Morsch is said to be the innocent carrier of millions of virulent germs, with which, while himself remaining in good health, he spreads sickness among others"

TYPHOID IN CATTARAUGUS COUNTY

A typhoid epidemic has developed in the City of Olean, Cattaragus County, according to newspaper reports carried by numerous publications throughout the State. The New York Herald-Tribune of October 7 says

"Typhoid fever cases in Olean to-day totaled ninety-six, with twenty-six additional cases suspected and under observation. The epidemic, which has taken one life, began several days ago and is believed to have been caused by impure water taken from wells in the southern section of the city.

"The American Red Cross has ordered seven nurses to proceed immediately to Olean, N Y, from which reports of typhoid fever have been received. Miss Marie Whipple, secretary of the Olean chapter, told national headquarters that she had been requested to take charge of an emergency hospital established by the city."

The story of the outbreak is one of lack of cooperation between the water supply authorities and those of the health department. The City of Olean filters and chlorinates its main supply of water, but it only chlorinates an auxiliary supply which is drawn from open wells. Reports are that even the chlorination was done irregularly and without exact adjustments and tests

Moreover, a rule of the State Department of Health is that any change in a public water supply shall be reported to the health authorities at once. The auxiliary supply was used at intervals for over six months without being reported or being properly tested and chlorinated

A further point is that outbreaks of diarrhea have developed in Olean during the summer, and have involved hundreds of people at a time—an almost sure sign that polluted water has been used. Finally came the typhoid infection. The explanation is that sewage was reaching the wells, and the chemical toxins in it caused the diarrheas. Finally, however, live typhoid germs reached the wells and produced typhoid fever in many of those who drank the water.

Water companies have frequently changed their source of supplies without reporting the change to the health authorities The best way to guard against the unauthorized changes is that the departments of health shall inspect the water plants often, and shall determine for themselves whether or not the companies are taking the proper pre-Water companies are commercial organizations and are likely to plead poverty when they are asked to make regular tests and to install filtration and chlorination apparatus people are prone to excuse the water companies for neglect to safeguard the water, and to charge the health authorities with meddlesomeness when they inspect the plants The danger from waterborne infection seems to be in inverse proportion to the size of the place A big city like New York has a pure water supply, it is the small city, like Olean that draws its water from an infected source

Olean is located in Cattaragus County whose health department has often been cited as a model in health protection

CIVILITY-A POEM WITH A MORAL

James J Montague frequently supplies the New York Herald-Tribunc with verses which are exceedingly attractive though they end with a moral The following poem in the issue of October 11th illustrates the virtue of civility, even if it is at

"The bee is neither good nor kind,
His disposition's far from sunny,
And when he dies he leaves behind
A fortune in the form of honey
And so, while he abides on earth,
In spite of all the deuce he raises,
We ardently extol his worth
And chant his praises

The wasp is no more prone to rage
Than is his grim but affluent neighbor,
But he refuses to engage
In any sort of useful labor
No riches leaves he in his hive
To titillate our expectations,
And so we greet him, while alive,
With objurations

the expense of scientific accuracy, but then one does not expect entire accuracy in a poem, especially in one printed in a department which has for its heading the suggestive title "More truth than poetry"

It must be pleasant to be rude
To persons whom we do not fancy,
But people who are not endued
With fame or fortune find it chancy
The bee the right to use his sting
On prince or pauper is allotted,
The wasp that tries the self-same thing
Gets swiftly swatted

If you, dear reader, have the power
Upon the world largesse to scatter,
You may be cross, or mean or sour—
Your disposition will not matter
But if by penury's grim thrall
You find that you are held in fetter,
Civility to one and all
Will pay you better"

THE SERVANT PROBLEM

The more prosperous an American doctor is, the more he feels the acuteness of the servant problem in his household. The New York Times of October 17 discusses the servant problem in Germany and refers to new legislation for the protection of servants.

"Under the law they may not be required to work 'more than fifteen hours a day' Once each week they have an afternoon off, and alternate Sundays are theirs They must have a comfortable room and 'one warm meal daily,' although hausfraus are not required to feed them what the family eats and they do not venture to demand

It They may not use electric light in their rooms, candle light being held sufficient for their purposes, and a monthly wage of forty-eight marks plus the tax of twenty is now the minimum

"Some of the younger servants, particularly those in the employ of young mistresses, have taken to bobbing their hair and wearing silk stockings on their off days. This is looked upon by the older women as the beginning of the social ruin of Germany. The next time a New York servant complains of her lot it might be wise to acquaint her with the terms of what is considered a good job in Berlin."

CHILDREN THE FASHION

The small number of children in well-to-do American families is a subject of frequent articles in newspapers and magazines. France and England have their problems of birth control Whatever be the reasons assigned, the principal reason of all is that of conformity to the prevailing style, and who shall deny the possibility of a return of the style of the large family? This subject is discussed in the following editorial from the New York Herald Tribine of October

"'We in London,' says Dr George F Buchan, its medical officer, 'find there have been cycles in which the one or no child fashion prevailed, but the big-family idea returned, and present indi-

cations are that we are starting on another big-family cycle, or will be soon'

"It has been noticed over here, too, by those who observe closely the habits of the fashionable world, that children are becoming the style, that the really smart thing for milady now is to become a mother and carry about a little darling of the human rather than of the canine species. Possibly it is due to a realization that the one is hardly more trouble in the long run than the other, but more probably it is the long campaign of jokes at the expense of the lapdog and of his mistress, and also of the nominal head of such a household, that has turned the tide. Wives are beginning to understand that they cut a more becoming figure as mothers"

BOOK REVIEWS

RECENT ADVANCES IN MEDICINE CLINICAL—LABORATORY—THERAPEUTIC. By G E. BEAUMONT, M.A., D M, and E. C Dodds, M.D Fourth Edition 12mo of 426 pages, illustrated. Philadelphia, P Blakiston's Son & Company, 1928 Cloth, \$3 50

The reviewer recommends that every physician, who is unfamiliar with this little book, make its acquaintance. In the course of four years the medical public has created a demand for it which has necessitated the publication of four editions And justly so The book may well be given a place in the physician's library near Osler's text-book, to supplement the latter in matters to which Osler gives brief or no mention—for instance pancreatic insufficiency (non-diabetic), methods and in-terpretation of blood chemistry, cholecystography, newer methods of treating diabetes mellitus, van den Bergh's and other tests of liver function, Dick test, lipiodol, sedimentation test, artificial pneumothorax, etc. An especial virtue of this book is that the authors possess the faculty of giving, in easily readable language, great detail on a subject with the use of but few words In space, in which most authors could give but intro-ductory knowledge of a subject, they have been able to give detailed information. To mention but a single to give detailed information example, a man knowing nothing of electrocardiography can acquire a good working knowledge thereof by reading the thirteen pages of the book devoted to that topic. This book can be recommended to him who would read it from cover to cover in a series of sittings and to him who would use it as a work of reference. ISRAEL H MARCUS

NUTRITION By WALTER H EDDY, Ph.D 12mo of 237 pages Baltimore, The Williams and Wilkins Company, 1928 Cloth, 2 50

The author needs no introduction to students of Nutrition, whether they be medical practitioners or laymen. Some of the most valuable work done in this country on the subject of nutrition has been done in Dr Eddy's laboratory under his supervision. The text of the book is divided into two main parts, about equal in size. The first is on General Food Requirements, and the second, on Vitamin Requirements.

In the first part, some of the questions taken up are The Requirements of a Complete Food, Energy Requirements, and The Requirements of Fat, Carbohydrates, and Proteins Next are considered, The Inorganic or Muneral Requirements, and The Digestibility Eartor

Mineral Requirements, and The Digestibility Factor
In the second half, The Vitamin Requirements are
taken up, showing how the vitamin value of food is
determined, how cooking affects the vitamin, and how
the vitamins function in the body. While apparently
intended for the use of the physician, the style is so
beautifully clear that it can easily be read and understood by the laity.

WM HENRY DONNELLY

GYNECOLOGY By WILLIAM P GRAVES, A.B., M.D. Fourth Edition, revised. Octavo of 1,016 pages, illustrated. Philadelphia and London, W. B. Saunders Company, 1928. Cloth, \$10.50

This work is designed both as a text-book and general reference book of Gynecology To meet these two requirements, a special classification has been adopted, dividing the subject matter into three distinct parts

dividing the subject matter into three distinct parts
Part I deals with the physiology of the pelvic organs,
and with the relationship of gynecology to the general
organism.

organism.

Part II is designed for the undergraduate who is taking his initial course in gynecology. It includes a description of diseases which are essentially gynecologic.

In the description of each disease, the pathologic process is illustrated by beautiful drawings from microscopic sections, with full descriptive legends

Part III is devoted entirely to the technic of gynecologic surgery. Gynecologic operations are innumerable, and Dr Graves has limited the operations presented in his book to those which he himself considers best suited for the special requirements

The author is to be congratulated on his painstaking date, and beautifully illustrated. It is a monument to Dr Graves standing as a gynecologic surgeon, and as an author

The volume will be most helpful to the student, the general practitioner, and the gynecologist, for it ranks as one of the very best books on diseases of women

The author is to be congratulated on his painstaking work, which has brought this fourth edition to its present high standard WSS

CLINICAL MEDICINE. By OSCAR W BETHEA, M D Octavo of 700 pages Philadelphia and London, W B Saunders Company, 1928 Cloth, \$750

This book is designed for the use of those practitioners who are obliged to treat their patients without the aid of precision. It is written by a teacher of therapeutics. About two-thirds of its pages are devoted to treatment. The rest is apparently designed to enable the reader to label his patients so that he can turn to the proper page to find out what to do for them. After reading the description of a clinical picture and of the therapeutic measures advised for its treatment, one is left with a feeling that he knows nothing of what is supposed to be happening, or how what is happening is supposed to be modified by its treatment. Perhaps this is inevitable in a work of this size, but it does seem as though the men who are handicapped by lack of facilities need even more than others to employ reason rather than rote so far as it is possible in their work.

A HANDBOOK OF CLINICAL GYNECOLOGY AND OBSTETRICS. By RAE THORNTON LA VAKE, A.B., M.D. Octavo of 281 pages, illustrated. St. Lows, The C. V. Mosby Company, 1928. Cloth, \$4.00

This volume is designed for the student who is organizing his knowledge of many gynecologic and obstetric methods, facts and opinions for the purposes of practical application

The author has covered a great deal of ground in a short space, and he has skillfully brought out, and touched upon only major topics.

The book is not one for reference, nor is it valuable to the general practitioner, because it is too brief. It is however, very valuable for students who wish to get a short, brief survey of these two subjects, and who wish to fix in their minds the main points in examination, technique and treatment.

We S. S.

BED-SIDE MEDICINE. A Hand-Book of Medical Diagnosis—Symptoms, Physical Signs, and Laboratory Methods—From Indian Standpoint. By Akhil Ranjan Majumdar, MB 12mo of 443 pages illustrated. Calcutta The Book Company, Limited, 1928 Cloth, Rs 6-8

This book will meet but a poor reception in the United States Containing nothing but the elementary facts of medicine, facts of which every physician is already fully cognizant, it can serve no useful purpose. If the physicians of India can derive benefit from such a book, then the state of Medicine in that land is to be lamented.

You Are Not Pioneering When You Prescribe

DRYCO

for Infant Feeding

- 1. Years of international clinical history have established its merit.
- 2. Current medical literature bears frequent reference to its efficacy.
- 3. Thousands of physicians know from experience that it can be depended upon for good results.

There is as great a difference between Dryco and ordinary dried milk as there is between certified and other liquid milk. The results obtained with the use of Dryco have made it an incontrovertible fact that Dryco is ideal for infants deprived of breast milk and is of especial value in difficult feeding cases.

PARK ROW, NEW YORK, N. Y.

OUR NEIGHBORS

PUBLIC ACTIVITIES COMMITTEE OF NEBRASKA

The relation of the physician to volunteer health organizations is a vital problem in Nebraska as well as in New York. What the Public Activities Committee of the Nebraska State Medical Association is trying to do is told in the following extracts from an editorial in the September issue of the Nebraska State Journal.

"The purpose of the Public Activities Committee is to improve the relations between the public and the profession—to bring them closer together by telling the public what we have in our catalogue. The purpose of it is not to damn the cults or talk about them or consider them at all, but simply to tell the public what we have to offer, because it is in a receptive mood and anxious to hear these things. It will receive the news we give with open arms

"Why is this thing necessary? Because the charletans and quacks and 'ism's and cults are giving misinformation of all sorts to the people. It is our duty to the public to protect it from fraud in matters pertaining to health. A wave going over the country rapidly from east to west is socialized medicine. We may think it does not confront us now, but it does confront us, and seriously, too

"It isn't by choice our organization takes up this matter of health education of the public. It is because the people have a right to know how to live. It is a social problem. They have a right to know how to improve their living. If you do not give the information to them, somebody else will. These lay organizations carry to the public the knowledge the scientific men have developed in their laboratories.

"At the National Health Conference which I attended last month, the representatives from the social workers were very much in the majority. When a dispute arose as to whether the medical profession should help the social laymen in health education, a lay worker said 'As far as we are concerned, the medical profession can go to the devil! We can hire all the doctors we want for \$150 a month. We are putting on this program and will continue to do it, because the doctors will not, and have not.'

"There is not a state that does not have state medicine to some extent now. It is simply our failure to get the things done we know should be done that put state medicine and socialized medicine in the foreground

The cults and 'ism's knew enough to do it The thing for us to do is to present to the public what we have in our storehouse, and they will accept it because they inherently believe in us

"The only thing we have to do is to improve our relationships with ourselves, and carry the things we know how to do to the public It takes a long time to do these things. We have made a few demonstrations. I shall refer to three

"Last year we attempted to put on a demonstration at the State Fair, which we know is a group of lay people. We put on a pathological exhibit and a display of Paleopathological specimens Dr. Young had furnished, and wondered what we were going to do with them. The crowd came in and asked, 'What are these things? How can we prevent having this disease?'

"We started to tell the people how gallbladder disease might possibly be stopped and how the various diseases these specimens represented might be prevented, with the result the demonstration evolved itself into a series of short lectures which continued throughout the day We had a little pamphlet called 'Keep Well' which the nurses passed out to the people who had heard the lecture When we counted the pamphlets to find how many people we had talked to, we found over five thousand people had heard the lectures on the first day That was the biggest day, but we can safely say over fifteen thousand people from the rural districts heard the simple messages of long life

"The question brought to us most often was, 'Why haven't the doctors been doing this thing before?'

"This has opened our eyes and the eyes of the State Board of Agriculture This year when we asked for space, they gave us an entire building in a desirable location

"What will we do? Our idea is to carry on these lectures by displaying a pathological specimen which means nothing to the lay man until it is explained, and follow it with a health message "This is a cancer Long before the person has reached this stage, the time has passed when the disease can be cured'

"Besides the display and talks which we will have continuously throughout the afternoon, we have arranged for a suite of offices in the

Would you silence an SOS call?

CERTAIN types of X-Ray apparatus kill all radio reception in the neighborhood. They even prevent the receiving of SOS calls from disabled ships or planes

The management of every hospital that has X-Ray apparatus of this type is well aware of how its neighbors feel about it, and of the disappointment in the convalescent ward and the nurses' home because of radio interference. But many think there is no way of avoiding it. Few know the real facts about X-Ray interference with radio

The Wappler Electric Company, Inc, has prepared a monograph on this subject which explains why certain types of X-Ray apparatus interfere with radio and how such interference can be avoided. It contains also valuable information regarding the most recent improvements in X-Ray apparatus. Mail this coupon for it now, free

Woman's building where we will carry on a periodic health examination to one applicant. from each county in the state, this applicant to be selected by the county secretary and his history written at home. He is to be a representative citizen and apparently well We have arranged that these men will pass through the hands of a group of physicians who are trained to make these examinations and who are honest and uninterested in that particular patient. An opinion as to his pres-Why? For the ent condition will be given purpose of popularizing periodic health examination with the people We have been talking about it among ourselves for several We all believe in it, but we have had little effect in taking it to the public learned the Nebraska law requires every teacher teaching in the schools of the state to make a physical examination of the students at the beginning of the school year We carried this knowledge to the teachers' colleges of the state and offered to put on a Health Education course which was graciously accepted Within the Peru Teachers College where we introduced this course we had a series of nine

lectures dealing with various phases of school health to qualify the teacher, not to make a diagnosis, but to determine the difference between sickness and health. She was instructed to dismiss the child from school in case he was ill, and do it intelligently, and carry on the health programs which are now furnished to her from various organizations. That course has been completed. The president of the college calls it his 'Ten Thousand Dollar Lecture Course'. He refers to it as the most progressive step that has been taken in his college in ten years, for it is along the lines of influencing the people in healthy living

"What is the result of this education? We have medical men teaching health—teaching how to make these examinations—and we are keeping the teacher and all of her pupils within the channels of the medical profession. If we do not do these things, what happens? It is like the child who is reaching adolescence. If he gets no knowledge on sex problems from his parents, he gets it from somewhere else. The same is true of the public. They will get information somewhere, and the cults are glad to supply it"

KLIM vs. Boiled Milk

KLIM Powdered Whole Milk possesses all the favorable attributes of boiled milk for infant feeding yet has none of its objectionable characteristics

It is safe, due to the absence of pathogens, yet not sterile Its curd is soft and friable Furthermore it has at no stage in its making been subjected to temperatures higher than that of pasteurization (145 degrees F)

Klim, therefore, is as safe and as digestible as boiled milk and as it has not been oxidized, is the biological equal of raw milk.

It is more convenient for the mother to use, is more uniform, and may be taken on trips or fed under any circumstances or conditions

KLIM

POWDERED WHOLE MILK

Merrell-Soule Powdered Milk Products are packed to keep indefinitely Therefore, trade packages need no expiration date

In addition to KLIM Merrell-Soule offers

POWDERED PROTEIN MILK

This is the dehydrated equivalent of Finkelstein soriginal Enversamilch Sustained pediatric recognition and approval testify to the fact that Merrell Soule Powdered Protein Milk has a definite place in infant feeding

POWDERED WHOLE LACTIC ACID MILK

This is correct in composition and actidity preserving all the qualities of a hospital formula. It is easily prepared in the home and is a demonstrated clinical success

(Recognizing the importance of scientific control all contact with the lasty is predicated on the policy that K LIM and its allied products be used in infant feeding only according to a physician's formula.)

(Continued from page 1320-adv vvi)

follow abdominal operations, and the usual source of infection is the intestine of the patient. The intestines of five per cent of persons contain tetanus germs and spores which are ready to grow when they are inoculated into the abdominal tissues

American physicians may be assured that the sutures in their original tubes are sterile However, there is obvious need of extreme care in maintaining asepsis in abdominal operations especially in cases involving the digestive tract.

KENTUCKY SCHOOL FOR HEALTH OFFICERS

The July issue of the Kentucky Medical Journal contains an article on the recent Annual School for health officers conducted by the State of Kentucky, from the pen of one of the health officers, who writes

"It has been my privilege and pleasure to attend every meeting of the school for county and city health officers conducted by our State Board of Health since its organization in 1912, but, never before have I enjoyed a meeting and came away with so much knowledge as the recent one I feel the profession of the state should know what great work the State Board of Health is doing in training its health officers

"The meeting was opened with a prayer by Doctor Arthur McCormack, our beloved state health officer This invocation was worthy of an eminent divine and was a thanksgiving from the heart. This was 'no word of mouth' but a grateful prayer for the deliverance of health officers from political assault and a prayer to give them grace for greater health work.

"Doctor Lillian H South, director of the Bureau of Laboratories, as usual, gave one of her demonstrations that are always looked forward to by the health officers. We are at all times proud of the work that she is doing Everything new that is available in laboratory technique she acquires and demonstrates each year at these meetings

"Doctor T A. Frazer of Marion, who is one of our oldest in point of service as a part time health officer gave a most interesting talk on the study of wild life as a hobby Doctor Frazer is in constant demand by the broadcasting associations for his talk and it was a real treat to hear him at this meeting and over WHAS

"Kentucky now has thirty-five all time health departments and thirty-five all time health officers and it was quite a pleasure to

TETANUS SPORES IN SUTURES

The London Letter, in the Journal of the American Medical Association, for July 28, discusses an outbreak of nine cases of post-operative tetanus and one of gas gangrene which occurred in a limited period of time in one institution "The tetanus cases consisted of six gynecologic operations (all repair operations except one—an oophorectomy and appendicectomy), one cholecystectomy, one nephrectomy and one gastro-enterostomy The gas gangrene case was removal of an exostosis of the leg The operators were ten different surgeons

"Thus, most of the cases followed gynecologic operations, particularly repair operations. In all cases, catgut had been employed and that entirely from one source. In one operation the catgut was used directly from sealed tubes. In the others it was prepared for surgical use by processes which are described."

The article is vague and incomplete, but it gives one the impression that the sterilization of sutures in the British Isles is done principally by chemicals. In contrast with this method is that followed in the United States,—sterilization by a high degree of heat,—as described in this Journal of October 15, 1927, page 1155. The American method is to seal the catgut sutures in tubes containing totuol and sterilize them at a temperature of 329°F for at least five hours. No living thing can survive this process.

American manufacturers make rigid tests of the sterility of their products. The need of testing is mentioned in the London Letter as follows

"At present there is no control by any health authority over the manufacture of surgical catgut liable to carry dangerous bacterial spores and intended for introduction, sometimes in The same large quantity, into the tissues control as that now exercised, under the Therapeutic Substances Act, by the ministry of health over the manufacture of vaccines, antiserums and certain other biologic products, should be applied to catgut, such control would assist and guide manufacturers of surgical catgut in standardizing their methods and safeguarding their products Under the act referred to, rigorous sterility tests are demanded in the case of antiserums and vaccines is the same need for bacteriologic control tests of catgut supplied in sealed tubes and 'guaranteed to be sterile"

Post-operative tetanus sometimes occurs in the United States although the surgeons are not keen to report them They nearly always

"3 A physician from the State Department of Public Health will give the first injection of town-antitown with the understanding that physicians are to complete the series, the state furnishing a nurse to organize and assist in the clinics

"4 The State Department of Public Health to take over the entire immunization program in the county by consent of the Health Officer

and physicians

"5 In organized counties with county health departments the State Department of Public Health will furnish the educational material and toxin-antitoxin only. The work of immunization is to be prosecuted by the local full-time county health department in cooperation with the local medical profession."

THE PENNSYLVANIA MEDICAL JOURNAL

The name of the official organ of the Medical Society of the State of Pennsylvania, which has undergone several changes of name, now resumes its former name, *Pennsylvania Medical Journal*, as is described in the following editorial in the October issue

"With this issue we return once again to our old name—a name dear to the hearts of many of our members and dignified by long years of service to the profession of Pennsylvania This marks the end of a dream of expansion into a larger sectional publication, yet many of our readers are glad to see the abandonment of that dream for the development of a journal more intimate and personal to our own Society

"The Pennsylvania Medical Journal has had a long and interesting history, if one can but reconstruct the dry bones of dates and names into living, vivid personalities that produced the publication which has lived forty-two years

"Founded in 1886 by Dr X O Werder as the Pittsburgh Medical Review, and conducted by an editorial board, can you imagine the hopes and fears which went into the first years of its infancy? In 1892 Dr Adolph Koenig, of Pittsburgh, assumed the editorship, and in 1897 the name was changed to the Pennsylvania Medical Journal, and it became the first state medical journal in America.

"The ownership and editorship was transferred in 1904 to the late Dr Cyrus Lee Stevens, of Athens, who carried on the work until the burden became too much for his failing strength

"At Dr Stevens's request, the State Society relieved him of the Journal in 1920, and it became the actual property of the Medical Society of the State of Pennsylvania upon payment

Dr

Address

of one dollar The office was transferred to Harrisburg, and Dr Frederick L. Van Sickle became the editor. Under his editorship and with the added support given by the Society, the Journal continued to develop, both as to size, advertising, and income. In 1923 the name was changed to the Atlantic Medical Journal and the Medical Society of Delaware joined with us in its publication.

"The present editor was appointed in 1925 The Journal has continued to grow and thrive satisfactorily, but for reasons already announced the decision was taken to return to the old beloved name, the *Pennsylvania Medical Journal* It is our earnest hope that we may continue worthily in the path of service and that our place in the hearts of our members and

readers will not fail"

The "Dream of Expansion" to which the editorial writer refers in his opening paragraph was a plan that the medical societies of the Middle Atlantic States should unite in the publication of a single medical journal, whose name should be the Atlantic Medical Journal and whose circulation should attract the highest class of contributors and advertisers, Delaware was the only State that joined in the publication of the Atlantic Journal, and now Delaware has withdrawn and the name of the Journal is changed back to the Pennsylvania Medical Journal for it represents Pennsylvania only This action is in contrast with that of the Boston Medical Journal which enlarged its scope to include all New England and changed its name accordingly

STUDENT HEALTH SERVICE IN THE OHIO STATE UNIVERSITY

The Ohio State University at Columbus has reorganized its health service for the ten thousand persons in the college community. The new organization is described in the October issue of the Ohio State Medical Journal, which in turn quotes the description from the Ohio State Lantern, the official publication of the student body—Editor's note

"The health service will be financed by part of an additional fee of \$1 per quarter per student authorized by the Board of Trustees While the emphasis of the service will be on preventive medicine through education, it will give first treatment or medical reference to students suffering from injury or illness. It will advise and refer to specialized care, students suffering from chronic injury or disease and will advise students in matters concerning health and personal hygiene

"It will furnish students with medical ex-

(Continued on page 1325-adv xxi)

WISCONSIN LAW OF ASSISTANTS.

Mr F M Wylie, Counsel of the State Medical Society of Wisconsin, was asked, "Is it legal for a surgeon to do a major operation without a licensed physician as an assistant, where the case is not an emergency but in regular course and the surgeon has plenty of time to secure an assistant?"

"No law specifically requires a surgeon to have an assistant. Malpractice law requires a surgeon to exercise such care as surgeons usually exercise in the same or similar localities under the same or similar circum-This definition has been often discussed by the Wisconsin Supreme Court. A surgeon may adopt better methods than obtained in his locality but is not required to do so Locality is used in its ordinarily understood sense and distinguishes between city and rural conditions The availability and cost of aids are elements to be considered a question of fact in each case and one which can be established only by the expert testimony of surgeons acquainted with the standard of care applicable to the locality"

AN EPIDEMIC OF RACKETS

An example of kicking up a racket over an imaginary condition is described editorially in the October issue of the Journal of the Missouri State Medical Association, which says

"A tempest in a piepan subsided at Kansas City, August 22, when Health Director E W Cavaness returned from the American Public Health Association meeting in San Francisco and diagnosed an epidemic of 'food poisoning' as public hysteria, with 'rackets' as a complication

"Not rickets, rackets—a disease characterized by itching palms and a desire to go to court, or resort to more direct means to soothe the itch. Consummating these measures is informally known as 'racketeering,' and the person suffering from the disease is sometimes called a 'racketeer'.

"Probably 100 cases of 'food poisoning' were reported during the 'epidemic' About 25 suits were filed against bakers, accusing them of selling impure food, especially in the cream

(Continued on page 1327-adv xxiii)

(Continued from page 1326-adv xxu)

pies One woman who was both poor and pregnant had called in the physician who was to attend her in confinement. She had gastroenteritis. She had eaten part of a bakery pie. The physician promptly made a diagnosis of food poisoning and wrote out a bill for \$25 for the one call.

"Dr Cavaness made an unexpected call on the physician and pointed out that he had failed to report this case to the police and health departments. The Doctor at once admitted the case was not food poisoning, but that he believed a diagnosis of that sort and a bill for \$25 would immediately extract this sum from the baker, especially in view of the current wave of publicity and lawsuits

"Dr Cavaness found that there had been a few actual cases of food poisoning, but that the inspectors and laboratory had been very vigilant and most of the many reported were cases, rather, of 'rackets' His diagnosis was supported by the fact that no cases were reported after his investigation. We submit that, although investigation would have little effect on food poisoning, it might logically be expected to have precisely the effect indicated on 'rackets'

"A word remains to be said of the physician whose conscience was so shabby that he sought to make up a \$25 obstetical fee by a false diagnosis and a baseless claim. The memory probably will be cinchona to his palate and asafetida to his nostrils for many nine-months to come. We hope it will be bitter and rank enough to inhibit a recurrence of this quaint modern disease. And we rejoice to point out that he is only one among 6,000 physicians in Missouri, and we trust, as the past indicates, that he is about the only one who would take advantage of his professional knowledge to connive in a fraud upon business people."

THE SICK DOCTOR

The sick doctor is the subject of an editorial in the Medical Journal and Record of June 20 Just as the Pope and Cardinals of the Church have their priests to minister to their spiritual needs, so the physician needs the advice of another doctor who will consider his case with impersonal science. The editorial says

"The physician with a persistent pain needs more than a casual dose of soda bicarbonate or an aspirin tablet. He deserves competent attention just as much as the layman. In spite of his own claims to knowledge, he has a perfect right to be diagnosed and treated, or to be (Continued on tage 1328—adv. xxiv)

diagnosed and reassured, as anyone else Most doctors of whatever degree of fame or success are only too glad to be of help to their professional brethren and they say so, but still the modest sufferers hang back

"By far the worst offenders are physicians who, too busy to take proper recreation, fall victims to their 'nerves'. The timely advice of a psychiatrist might do much to relieve their distress and improve their efficiency, to say nothing of averting an impending breakdown. But do they seek help where it is freely available? Very seldom

"In addition to their dislike of 'bothering'

the psychiatrist, they have another even more cogent reason. They fear that they will be considered 'crazy' and their professional reputations will accordingly suffer. Fortunately the time is rapidly approaching when mental prophylaxis will be as common as dental prophylaxis, and it is to be hoped that physicians will be the first to realize the fact.

"The physician owes it to his patients to keep himself mentally and physically fit. To do so as things are, he must pay enough attention to his own condition to know when he needs expert advice and overcome his scruples sufficiently to seek that advice as his due whether he is permitted to pay for it or not."

RURAL PHYSICIANS IN MICHIGAN

The Granges of some of the Western States are advocating a shortened course in medicine for physicians practising in rural districts, on the ground that those who take the courses will settle in the country The Journal of the Michigan State Medical Society opposes the plan in the following editorial

"In 1889 was passed the Chandler Medical Act and the power of licensure was placed in the hands of the Michigan State Board of Registration in Medicine, composed of ten physicians Board for the last five years has admitted 1,550 physicians to practice (300 a year) which would seem to be an ample supply of new doctors It is but rarely, however, that one of them enters practice in a small community The National Grange claims that premedical and medical standards can be lowered and that physicians will then locate in rural communities to relieve dearth of doctors There are various reasons why physicians will not locate in the small community If the rural community can stop the emigration of its own young people to the city, and can offer better schools for the doctor's children, better facilities to practice his profession, and will support him financially so that he can work satisfactory to his standard of practice, the problem of the better distribution of physicians may be solved, and not before lower standard will not solve the problem, because the farmer and his family are more observing and critical than are their unsophisticated brother in the city faker or the poor doctor does not last long in a rural community because news travels fast in the country A poorly trained doctor is probably the most dangerous man in any community'

A Private Institution for the Care and Treatment of Nervous and Mental Diseases

Large private grounds. Home-like curroundings. Modern appointments Separate buildings for Patients desiring special attention. Single roomers suite Hydrotherapeutic apparatus. Terms recessable. New York Office, 121 East 60th St., 1st and 3rd Wednesdays only, from 1 to 3 P M. Tel., Regent 1613.

Dr F D Ruland, Medical Superintendent Westport, Conn. Phone, Westport 4

Dr. Barnes Sanitarium

STAMFORD, CONN

A Private Sanitarium for Mental and Nervous Diseases Also Cases of General Invalidism Cases of Alcoholism and Drug Addiction Accepted

A modern institution of detached buildings situated in a beautiful park of fifty acres, commanding superb views of Long Island Sound and surrounding hill country Completely equipped for scientific treatment and special attention needed in each individual case. Fifty minutes from New York City case Fifty minutes in Frequent train service.

> For terms and booklet address F H BARNES, M.D., Med. Supt Telephone, 1867 Stamford, Conn

WEST HILL

HENRY W LLOYD, M D HULDA E STAUFER

West 252nd St. and Fieldston Road Riverdale, New York City

HAROLD E. HOYT, M.D., Res Physician in Charge Located within the city limits it has all the advantages of a country sanitarium for those who are nervous or mentally ill In addition to the main building there are several attractive cottages in a ten acre park. Doctors may visit their pa tients and direct the treatment.

Telephone KINGSBRIDGE 3040

HENRY W Rogers, M D , Physician in Charge HELEN J ROGERS, M.D.

DR. ROGERS' HOSPITAL

Under State License 345 Edgecombe Ave. at 150th St., N Y C.

Mental and Neurological cases received on voluntary application and commitment. Treat ment also given for Alcoholism and Drug Addiction Conveniently located. Physicians may visit and cooperate in the care of their patients.

Telephone, EDGecombe 4801

BRIGHAM HALL HOSPITAL

Canandaigua, N Y.

A Private Hospital for Mental and Nervous Diseases

Licensed by the New York State Hospital Commission Founded in 1855

Beautifully located in the historic Lake Region of Central New York. Classification, special attention and individual care.

> Physician in charge, Robert G Cook, M.D.

BREEZEHURST TERRACE

DR HARRISON'S SANITARIUM

For Nervous and Mental Diseases and Alcoholic Addiction

Beautiful surroundings Thirty minutes from Pennsylvania Station, New York.

For particulars apply to Dr. S EDWARD FRETZ, Physician in Charge

> Whitestone, L. L., N Y Phone Flushing 0213

HALCYON REST

105 Boston Post Road, Rye, New York Josephine M. Lloyd Hulda Thompson, R.N

Telephone Rye 550

For convalescents, aged persons or invalids who may require a permanent home including professional and nursing care. Mental or nervous allments not accepted.

Modern facilities in Electro Hydro and

Physiotherapy

Special attention to Diets.

The Medical Profession is extended a cordial invitation to make use of the facilities offered.

Inspection invited. Full information upon request.

New York Post-Graduate Medical School and Hospital

INTERNAL MEDICINE

INCLUDING

Diagnosis, Cardiology, Pulmonary Diseases, Gastro-Enterology, Endocrines, Metabolism, Arthritis, etc.

ENDOTHERMY VERSUS X-RAY AND RADIUM IN THE TREATMENT OF NEO-PLASTIC DISEASES OF THE SKIN AND MUCOUS MEMBRANE*

By GEORGE A. WYETH, MD, NEW YORK, N Y

SINCE the advent of Roentgen Rays and Radium great progress has been made in treatment of neoplastic diseases. Today the successful treatment of cancer depends upon two fundamental factors precise knowledge of the exact kind of tumor we are treating and knowledge of the exact form of treatment to which that particular kind of tumor will yield best. Some tumors respond better to radiation, some to other treatment.

There are in general two kinds of malignant tumors, anaplastic and adult There are in general two forms of treatment (1 e, as far as we are concerned today) endothermy (a refined surgery for cancer) and radiation which may be accomplished by x-rays or by radium The effect of radiation is most pronounced on anaplastic tumors on account of its inhibitory action on young and undifferentiated cells adult tumors the effect of radiation is less marked and in some cases it is practically That is, to affect the neoplasm a radiation intensity is required which will also destroy the surrounding tissue Those neoplasms which readily respond to radiation are spoken of as radiosensitive. Those which do not as radioresistant

Unless cognizance is taken of the fact that neoplasms are of varying types and of widely differing degrees of malignancy compilers of cancer statistics devote themselves to a labor that is of limited value Any cures of any epitheliomas are worth noting, but to be illuminative statistics must now classify by degree of malignancy the cases treated describe a lesion as an epithelioma or as an epidermoid carcinoma is no longer adequate To divide epitheliomas anto basal cell and squamous or prickle cell is not enough unless we at the same time make the important distinction that there is to be learned from the tumor itself the secret of its successful treatment

From the splendid work of Broders of the Mayo Clinic we are now able to classify neoplasms into Grades I, II, III and IV, according to the degree of malignancy or cell differen-Grades III and IV being least differentiated are more radiosensitive than are Grades and II This would seem to indicate that in treating these lesions radiation would be most effective. On the contrary it is in lesions of Grades III and IV that radiation most frequently fails This is because they are the most malignant types, they develop rapidly and metastasize early and although they are materially affected by irradiation too often not all of the cells on the outer edges are destroyed and the tumor progresses Thus we have a seeming paradox, a Grade IV, characterized by young and active radiosensitive cells, which is not permanently benefited by radiation It is known, however, that radiation of those highly malignant lesions of Grades III and IV causes them to become less malignant and makes them more immediately susceptible to treatment by scalpel surgery On account of the immediate, destructive effect of endogenous heat employed in endothermy in the removal of such lesions it is believed that endothermy's destruction is as final in Grades III and IV as in Grades I and II, provided metastasis has not already taken place We no longer use scalpel surgery in the treatment of cancer of whatever grade, wherever located Endothermy offers all scalpel can offer and we believe it accomplishes its purpose much more satisfactorily

We all remember the enthusiastic claims which were made a few years ago for the use of radium in the treatment of cancer and the promptness with which radium became the hope of all sufferers from neoplastic diseases who were afraid of the surgeon's knife Slowly we have seen this confidence shaken. There came first the reaction against the intense suffering induced by the use of radium, particularly in lesions of the mouth and buccal surfaces, and finally the conviction grew that

^{*}Read at the Annual Meeting of the Medical Society of the State of New York at Albany N Y May 23 1928

radium does not exert a selective action on all cancer cells It was found impossible to limit radium's destructive action to a shallow depth, as for instance in treating lesions of the cornea Applied to lesions in close provimity to bone, radium in efficient doses not infrequently causes a necrosis of the bone beyond the power of the operator to control Lesions in cartilage are particularly resistant, and it is not surprising that Hayes has recently said in the British Journal of Radiology, "It is evident that our present methods have not reached finality" Similarly, Kelly of Baltimore, pioneer radium therapist in this country, mentions among other radium difficulties, lack of uniformity of action, development of radioresistance, delay in securing results, need of repeated treatments, likelihood of harm from unskilful treatment through lack of experience The last mentioned is indeed likely to be an increasing menace if certain alluring advertisements addressed to the profession continue to offer prescription and to furnish radium treatment by mail

However, not all of radium's lack of success is due to inexperience. In the 1923 Report of the Memorial Hospital of New York City (the latest report to give results of treatment) there is reported on Page 48, treatment of 148 cases of epidermoid carcinoma of the tongue, 69 of which—458 percent—were primary growths without glandular involvement These were treated during the preceding three and one-half years and we learn from the Report issued by Douglas Quick that only 4 cases— 4 out of 148—were clinically free from disease more than two and one-half years from the

time of beginning treatment In 1925 Prof James Ewing, Director of Cancer Research of Memorial Hospital, said "Surgery is the only reliable method of treatment that can now be generally recommended, but radiation is of great value in many and is to be preferred in some cases" An evturpated cancer is the only safe one For this reason there has been constant and eager search for a method of treatment which adds to the finality of surgery a more complete protection against mechanical implantation of malignant cells and against recurrence a method is endothermy, the surgical application of high frequency currents, through which we have three procedures to desiccate the neoplasm, to coagulate the neoplasm or to excise the neoplasm with the endotherm knife which seals lymphatics as it cuts

In a paper presented before the Academy of Medicine of Cincinnati, Goosman said on "All of the subject of surgical diathermy these cases are treated with x-rays and radium and only the ones which fail to heal under radiotherapy are submitted to diathermy, as

the latter is a much more destructive process It is surprising, however, to see the excellent cosmetic results obtained after coagulating a

large area by this method"

Since the object in combating cancer is to destroy it and since, employed only in those cases which failed to heal under radiotherapy. diathermy has in Dr Goosman's experience proved a more destructive process than have either rountgen rays or radium, and has led to "excellent cosmetic results," one wonders what might be the doctor's results if he were to employ endothermy in the beginning in all those cases to which it is applicable

In the treatment of localized neoplasms which can be immediately removed, we no longer use roentgen rays or radium. They are time-consuming, uncertain in action and in this type of case should not be used Endothermy, an immediately destructive process, not dependent on tissue conversions is the method of choice Dosage is under the control of the operator, permitting him to remove in a single treatment an epidermoid carcinoma from the cornea without damaging the sight, from the vocal cords without destruction of the uninvolved portion, from depressed epitheliomas—as in the alae nasi—where radiation is difficult

To this accuracy of dosage in the hands of a trained operator is largely due endothermy's advantage over physical measures in avoiding the formation of undue fibrosis, in protecting against atrophy and disfiguring depigmentation following treatment of skin lesions, in preventing telangiectasis, in obviating aray cancers

In no other single group of cases is the value of the special technique of endothermy more strikingly exhibited than in the treatment of melanoma, tumors known to be defi-

nitely radioresistant

McFarland of Rochester, reported in the N Y STATE JOURNAL for January a striking list of six melanotic carcinomas which had been severally treated by almost the entire range of therapeutic agents, with a disastrous outcome in all We share the doctor's regret that delayed diagnosis and inconclusive treatment were here, as is too often the case, the misfortune of sufferers from melanin-containing growths Initial destruction of such cases by the protecting methods of endothermy tends to check the spread of the disease which so often occurs after scalpel excision

In discussing lesions of the mucous membranes what is said of the oral cavity is anplicable to lesions of mucous membranes elsewhere, such as antrum, larynx, bladder, etc., cavities which may be opened with the endotherm knife and made ready for proper, indicated technique of endothermy

Lack of time permits us here only to call attention to the advantages inherent in the endotherm knife for removing tissue for microscopical examination, a point, we believe, worthy of mention

For reasons that are not very clear, cancer lesions of the buccal mucosa are too often not brought to the attention of the surgeon until practically inoperable by ordinary methods, It may be that in the early stages cancer of the mouth is not very painful and that the patient does not realize the seriousness of the "sore spot." Truesdale has observed that "cancer of the tongue, except in the aged, grows rapidly, invades the lymphatics early and becomes hopelessly advanced in from six to nine months" This leads us to urge that any neoplasm of the mouth, however benign looking, should be removed, and that any ulcer, the cause of which is unknown, which resists treatment for three weeks, should at once be brought to the attention of the specialist for diagnosis Many cases of cancer of the tongue show a four-plus Wassermann Cancer is often superimposed on a syphilitic base, but if the first practitioner consulted diagnoses syphilis and, unconscious of the presence of cancer, administers repeated doses of salvarsan while the more malignant lesion goes unattended, the loss of time may actually cost the patient his life

Endothermy is particularly indicated in mouth lesions. It offers precision of application, the practically immediate cessation of suffering, freedom from shock and hemorrhage, and that early return to normal diet which is so urgently needed by the cancer sufferer. It further protects against the dangers of

metastasis and the likelihood of recurrence by removing the tumor immediately as a dead mass instead of a group of viable cells. The resultant scar is supple, pliable and Nature subsequently restores much of the excised tissue.

We would not suggest that the results of endothermy are achieved by the nonchalant turning on of one or another of the currents It is the result of a sound surgical training and a thorough knowledge of the precise use of the currents which differ so widely in character and effect To use bipolar endothermy (coagulation) when monopolar (desiccation) is indicated is to fail of achieving a proper and possible result Wider destruction is caused, more scar tissue is formed To use monopolar endothermy when bipolar is indicated is to fall short of that assurance which can be achieved by using the proper current. Likewise, when a lesion is such that it should be excised with the endotherm knife the employment of either desiccation or coagulation will not be satisfactory

In the march of progress, wishing to take advantage of newer methods, many men are now using these destructive currents with but little knowledge of their power and characteristics. Special training in the use of endothermy is not difficult to secure and results more than warrant the time and study needed to secure it. The well-equipped practitioner will find many cases in which he will want to use radiation in conjunction with endothermy, he will find many cases which will need radiation alone and he will find many others for which no treatment is so suitable as endothermy

PNEUMONIA*

Its Nature, Causes and Varieties, with Treatment.

By JOHN D BONNAR, MD, CM, BUFFALO, N Y

In the economy of nature, we find specialization a marked feature. Only to a very limited degree, can any substitution, or aid be given by one organ for the relief of another. This plainly shows that self-help is fundamental in vital processes, as indeed in industry. Were this not the case, confusion must and would result. Therefore are laws written in nature and made serviceable to man Their violation carries with it just punishment.

* Address given over Radio Station WGR, Buffalo N Y September 13 1928 In brief, health and its maintenance, are natural duties devolving upon individuals, as well as communities. Shirking these primary laws is no evidence that such laws are futile or harsh. No, on the contrary, they mark the straight path to freedom.

Order is heaven's first law To build well, we need plans and specifications, else the product is bound to prove a misfit and end in confusion. Nothing succeeds like success Nothing can bring it about without order and system—the very egis of big business and big profits. To assail success, its accusers brand

themselves as purile and prove an hindrance to progress. The inference is plain, that human welfare depends upon prevention of doing wrong and promotion of doing all things for the best

Every cell, or molecule, in the animal or vegetable kingdom, is fitted for its own sphere of action As a sentinel, it either marks time. or moves to duty, when service is needed to maintain the life or promote the growth of its parent structure. In like manner, but in greater degree, organs perform special service in the body as a whole None is fitted to fill the place of another, yet, none can refuse to serve others, as best they can, when the need arises for co-operation Therefore, our true interests depend upon service, in the truest sense of the term To determine what that means, presupposes familiarity with the problem in hand Pneumonia is a household It ceases to be technical, as we use The layman, not versed in the minute features of the disease, is fully aware of the fact that it means—Inflammation of the On the other hand, the physician embraces in that term the minute elements of the disease as a whole-not alone of the lung Without such knowledge, his service, in treatment of the disease, must prove a great Hence, whatever may illucidate the subject, in the least degree, may prove a life-

The "Tripod" of life is composed of the Brain, Heart and Lungs These are the, so called, "Vital" organs To maintain life, each of these organs must continue to do its part in the economy of the body The function of the lung is to breathe. The object of breathing is purification of the blood bonaceous waste products of the body, circulating in the blood, when passing thru the lungs, meet the air we inhale, and Oxygen is absorbed from that air and combines with the Carbon in the blood, making a chemical body, called carbon dioxide, which is a gas, that flies off with each exhalationoutgoing breath Unless the rhythm, so to speak, is maintained, the body soon suffers from poisoning by its own products, that should escape from the system Asphynia will soon follow, when the carbon is not The victim must succumb, if relief is not secured within reasonable time we see the great responsibility resting upon the medical man, in charge of the case purpose in addressing you tonight is a clarification of the subject-Pneumonia-and what 1t 1S

To determine what Pneumonia is, we will now invite your attention to the group of organs most directly implicated in the sick ness Primarily, the lung, or lungs, are the

seat of the disease The heart and brain, the other two members of the Tripod, become affected, in greater or lesser degree, if discase becomes serious The blood current propelled by the heart, is pumped directly into the lungs. On its return from lungs, it is then sent forward to the body as a whole—the brain, getting its supply most directly, senses the situation more quickly than remote parts of the body. Also being the other unit in the three "vital organs," its place is close to the seat of trouble and feels it quickly. Thus, we see at a glance, why Pneumonia is a hazardous disease and calls for prompt and vigilant care.

While there are causes, that predispose the body to succumb to Pneumonia, such as exhaustion, from hard or unusual toil, liquor habit, exposure to chill and wetness and cold drafts, the exciting cause, is a germ, called Vigorous health, in this, as Pneumococcus in all sickness, proves the trite answer of a physician to the enquiry, "Doctor, what is the best remedy for a certain disease?" Promptly replied-"Good Health' So, in like manner, I advise it for Pneumonia However, dealing as we must, with the actual lung inflammation, it is obvious that treatment must meet the issue and, if possible, save the life of the That the average death-rate of this disease ranges from 20-50%, of those attacked, none will hesitate to accept any practicable plan of treatment, which will assure a lowering of the fatality Nor will we hesitate to listen with patience to all rational advice, that offers any new hope

All disease is a battle between the forces of invasion, on the one hand, and the forces of defense, on the other The invaders may be likened to "Shock Troops," who pour in every deadly missile into the ranks of the de-On the other hand, the defense with like fury, engages the enemy in mortal strug-Victory depends on strategy, strength and environment To repel the enemy and save the life and powers of the patient, in the case of disease, is the object sought Just how to effect this outcome is my theme. How to do it with least loss to the patient and greatest credit to the physician is alike vital in shaping a verdict

As already mentioned, the previous health of the patient has much to do with the cure of the Pneumonia General debility, chill, exposure, excessive toil, exposure to wetness, poor food, bad air, loss of sleep or any excess or previous disease of lung, or other organ, lessen the chances of recovery As in a nation, so in the individual, success in warfare depends greatly on strength and strategy

Pneumonia or Broncho-pneumonia are generally ushered in by such chilling influence,

as exposure to cold draughts, wet feet, or lack of sufficient clothes, following perspiration from exhausting toil Short breathing, some pain and a hacking cough call attention to the case The physician is called On examination, he finds the lung-most generally, the lower lobe of the right lung-is dull and respiration is much lessened This is the Congestive stage of the sickness If prompt action is now taken, the disease in many cases can be aborted, as the doctors term it—popularly "RESOLUcalled "breaking up the cold" TION" is another technical term for checking the dread disease in this first stage fortunately, too often the case is either past this stage before suspected or detected and the real inflammatory pneumonia is ushered in

The Pneumococci, of which there are 3 recognized—some say 4—varieties, have won the first engagement, over the forces of defense—the Phagocytes These latter are an advance guard of the white blood cells, that, figuratively speaking, eat up the disease germs—"phago"—eat, being the root of the word It is now a case of life and death struggle Every available means for driving out or destroying the specific germs—the pneumococci—must be martialed

While the disease may be quite limited involving but one or more lobules, or smallest section of a lobe of the lung-it mostly embraces an entire lobe or, in very grave cases, found often as a result of Measles, more than In some such cases I one lobe is invaded have found both lungs filling up with the dis-The danger increases with the spread of the infection Right here, I wish to call attention to the fact, that from one-third to two-fifths of the lung must remain free from the pneumonia, in order to preserve breathing space in the organs, demanded in purifying the blood, by the oxygen of the air, or the patient will asphyxite!

Dullness of the lung, rusty sputa, crackling sound in the air tubes, high fever and short breathing tell the physician what the case is and he settles down to meet the issue. While diagnosis is of vital importance, the treatment is now the supreme question in driving out the disease and saving the life of the patient. Through the action of the germs, invading the lungs, toxins—organic poisons—are formed and enter the circulation. The heart and brain

are liable to infection and thus add enormously to the risk. Prompt remedy is therefore needed to avert these results. Later in the sickness, other disease germs, the Streptococci and Staphylococci, add to the specific pneumonia germs, new enemies, that must be met by special remedies. While this storm-centre is getting stronger, the patient is growing weaker—treatment is most vital

TREATMENT—the all-important issue—is now before us. It naturally resolves itself into three phases—Physical, Medicinal and Germicidal Under the first, we include proper ventilation, warm, comfortable bed and warm emollient applications over affected lung—changed every few hours. Posture of patient should be changed, to prevent settlement of blood to the low part—"hypostatic"—spoken of by the medical profession. To lower the fever, use a warm sponge bath. Also induce gentle perspiration. This shifts the blood to the capillaries of the skin and lessens the congestion in the deep parts—the inflamed lung included.

Medical—the second phase of treatment must be directed to secure drainage from the diseased lung—bogged up by the congestion and, at the same time, induce by the medicine, an increase of blood in the surface of the body Slight nausea will start secretion into the bronchial tubes, thus draining the diseased organ, while inducing perspiration, by relaxing the bloodvessels of the skin Physicians only can do this safely Constant care is vital to success and must be varied to meet the If pained, anodoynes may be condition needed, if heart is weak, cardiac tonics, for nervous prostration, stimulants For poor aeration of blood, Oxygen may be neededhypodermically, or by inhalation

For battling with the Pneumococci, several specifics are now used, creating in the diseased lung a flood of electrons—positive electric units—that dispel the germs. If suppuration occurs, then Streptococci have entered and should be met with anti-streptococcic serum. If abscess and gangrene occur, we must use powerful tonics, keep patient on sound side, to favor drainage together with specifics, such as Manganese and Gold chemicals. Any complications, as pleurisy, heart or brain infection, need added care.

DIABETES ALBUMINURICUS OR CHRONIC NEPHROSIS*

By ALBERT A. EPSTEIN, MD, NEW YORK, N Y

WHEN I was invited by your Chairman to choose some phase of renal disease for discussion before the Section on

*Read at the Annual Meeting of the Medical Society of the State of New York, at Albany N Y, May 23 1928

Pediatrics, I selected Diabetes Albuminuricus or Chronic Nephrosis not only because of its interest and importance, but because its comprehension is still not as clear to all as it should be, although twenty-five years have already

elapsed since the work on it was begun. In view of the uniformity of the clinical characteristics of this disease, the subject can be discussed without particular regard to the question of age. The only difference existing between the very young and the adult is in relation to the incidence of the complications which may arise and to which the young are more particularly prone.

The topic is a large one and time will not permit me to go into it fully but with your kind indulgence I shall try to present it as com-The term nephrosis was pletely as possible originally applied by Friedrich Mueller to a group of renal affections in which the dominant pathological change was degeneration of the renal tubules In this nomenclature were included not only those cases in which the degenerative process was restricted to the tubules but also in which the lesion in the tubules was but a part of the diffuse process affecting most or all the structures While a better classification of renal disease is now at hand, still the use of the term nephrosis as generally applied represents merely a compromise between clinician and pathologist From the pathological standpoint the term includes all forms of renal disease with tubular degeneration ranging in degree from cloudy swelling to necrosis of the tubular epithelium and amyloid degeneration, while according to the clinical conception the term refers to a group of diseases characterized by a chronic course, edema, oliguria, albuminuria, and the absence of hypertension and renal insufficiency

Despite the importance of the clinical character of the diseases in this category, emphasis is laid principally, by virtue of the term employed, upon the pathological changes in the In consequence, even according to the newer classification, chronic nephrosis still includes three distinct pathologic varieties the primary or genuine, or lipoid nephrosis, glomerulo-nephritis with nephrotic manifestations, and amyloid disease of the kidneys Notwithstanding numerous efforts to establish definite diagnostic criteria, positive differentiation of individual cases is frequently impossible since clinically one variety may closely resemble the Thus the use of the term "nephrosis" does not clarify the situation entirely, it still focuses our attention upon the ultimate pathological changes in the kidneys and does not take cognizance of other processes which contribute to the pathogenesis of this group of diseases

From my studies of the problem, 128 I have become convinced that the matter must be viewed in a different light. It is my opinion that the fundamental disease in so-called chronic nephrosis is not renal in origin for nature. In the series of publications re-

ferred to, I have attempted to present evidence showing that the pathological changes in the kidneys are of secondary importance only. The facts adduced point strongly to the conclusion that the disease is metabolic in origin, and the degeneration of the tubular epithelium of the kidneys, which is characteristic of nephrosis, is the consequence and not the cause of the disease while co-existing inflammatory processes and amyloid deposits in them may be either independent or incidental

It seems well established that in "primary" or "genuine" nephrosis the kidneys fail to show inflammatory changes, and there is sound reason for believing that the tubular degeneration and the lipoid infiltration which form a part of the pathologic picture are not of inflammatory origin. There are strong indications, too, that amyloidosis of the kidneys, to which reference has already been made, may not in reality be a distinct and specific disease as alleged, but the culminating effect of a protein intoxication incidental to or concomitant with the metabolic perversion which forms the basis of the so-called nephrosis

The first and foremost manifestation of nephrosis is an intense and persistent albumi-In many instances this phenomenon appears long before any other evidence of the disease develops, and its finding may be purely accidental or casual The question which requires our first consideration, therefore, is the albuminuria The proteins present in the urine in albuminuria have been found to be identical with the proteins of the blood mechanism by which albumin is excreted in the urine has been discussed at great length by the author in other publications 4567 In these the view has been expressed that the albuminuria in so-called nephrosis represents an active excretion of the serum proteins by the kidneys Because of a change in the proteins, be it chemical, physical or biological, as a result of which the body is unable to utilize them for whatever function proteins serve, they are excreted by the kidneys as foreign substances in the same manner that the kidneys excrete any other foreign matter present in, or introduced into, the blood stream Just as in diabetes mellitus the glycosuria results from the perversion of carbohydrate metabolism, so in this disease (the so-called nephrosis) the albuminuria has back of it a perversion in protein utilization. To this fundamental process I have applied the name "Diabetes Albuminuricus"

It is in consequence of the excretion of protein from the blood into the urine and its ultimate effect upon the organism that the muchdiscussed varieties of "nephrosis" assume the same secondary clinical manifestations namely the blood changes, the edema, and the oliguria

The first demonstrable effect of the albuminuria is the change in the content and composition of the blood proteins Their content decreases and the fall is proportionate to the duration and intensity of the albuminuria The output of protein in the urine may range from 5 to 50 grams a day The total amount of protein in the blood serum of a normal full grown person weighing 70 kilograms is approximately 210 grams When it is remembered that an albuminum of great intensity may last many weeks or months the protein depletion of the blood can be readily appreci-Thus while the normal protein content of the blood serum ranges between 65 and 82 grams per 100 cc, values have been found by me in this disease as low as 27 grams per 100 c c Coincident with the decrease in the total protein content in the blood serum is the change in the quantitative relations of the individual constituents Whereas normally the proportion of the globulin to albumin is approximately as 1 to 2, in these cases the globulin content rises and may constitute the major part of the protein present

In the studies referred to I have shown that loss of protein from any cause produces a reduction of the protein content of the blood In no instance however is the impoverishment of the blood in serum protein so pronounced, nor is the inversion of the albumin-globulin ratio of the serum protein so marked, as in the cases where the albuminuria is the result of the systemic disturbance to which I have applied the name of diabetes albuminuricus Neither in purely inflammatory diseases of the kidneys nor in any condition in which the anatomic integrity of the kidneys alone is disturbed, even to the point of complete destruction, as in surgical conditions, can such changes in the blood be noted

Another effect on the blood which I have studied closely and which has since been repeatedly observed by others is the accumulation of lipoid material in the blood 8 A milky appearance of the blood serum was observed by a number of the earlier investigators, including Bright, in cases corresponding to those under consideration They correctly ascribed this appearance to an increase in the fatty substances in the blood But while the milky appearance is to be observed in the blood serum in the more advanced cases, it is absent in the Nevertheless an increase in the fatty substances is practically a constant finding One of these fatty substances, the cholesterol, was studied intensively This substance is invariably increased during the active stages of the disease and more particularly when edema The level which it may reach is most extraordinary I have observed values as high as 13 gms per 100 cc of blood

The cause of this hypercholesterolemia is uncertain. The origin of the cholesterol present normally in the blood is also unknown. Some of it is exogenous and some endogenous. It is subject to fluctuation under a variety of conditions. In some it appears to be less dependent upon external causes than in others and is definitely associated with metabolic disturbances such as diabetes mellitus and diabetes albuminuricus, or so-called chronic nephrosis. There can also be no doubt as to the relation of the cholesterol content of the blood to the activity of certain glands of internal secretion as the suprarenal and the thyroid

The lipoidemia of diabetes albuminuricus is obviously different from that of diabetes mellitus It bears no relation to carbohydrate metabolism and is not associated either with acidosis or ketogenesis. It appears rather to arise directly from the peculiar impairment of protein metabolism, or protein loss. In physical appearance the lipoid-rich serum of diabetes albuminurious differs from that of diabetes mellitus in that free fat is not separated from the serum upon standing or centrifugalization It appears thus to be in closer physical or chemical contact with the blood proteins behaves differently in a metabolic sense also, since it does not lessen or disappear upon the elimination of fatty foods from the diet general character the lipoidemia of diabetes albuminurious is more like that which arises in endocrine disturbances particularly hypothyroidism. It is greater in intensity in diabetes albuminurious however than in any other known disease

In seeking an explanation for this phenomenon we find strong evidence which points to a deficient protein metabolism as the direct cause of the hypercholesterolemia As Lande and I have pointed out, a certain relationship exists between the basal metabolism and the cholesterol content of the blood Although the association is not constant, it may be said in general that conditions which depress the metabolic processes of the body cause an increase in the cholesterol content of the blood, while those which augment metabolism cause a de-Thus protein starvation, loss, or nonutilization cause a lipoidemia, while, conversely, protein feeding, pyrexia, and thyroid administration uniformly reduce the lipoidemia. Protein feeding augments metabolism by its specific dynamic action, fever heightens protein catabolism, while thyroid promotes the utilization of protein, all these effects are accomplished by a fall in the cholesterol content of the blood. These facts, as we shall see later, bear directly on the course and the treatment of the disease

In a measure the lipoid accumulation in the

blood in this disease is proportional to the loss of protein sustained by the blood and still more certainly is it proportional to the degree of systemic disturbance which accompanies it is perhaps the best measure that we possess of the tissue starvation and the metabolic perversion

Among the blood findings there is one other that is regarded as distinctive of the so-called chronic nephrosis or diabetes albuminuricus This is the non-protein nitrogen. The lack of retention of this constituent in the blood is usually considered as a criterion in the differential diagnosis between this condition (diabetes albuminurious) and true renal diseases This however is misleading because retention of nitrogen takes place in both types of diseases, although in diabetes albuminurious (the so-called chronic nephrosis) it is due to a different cause and is not manifest as such in the examination of the blood

One of the most striking clinical manifestations of diabetes albuminurious or so-called nephrosis is the development of edema or Its occurrence is intimately associated with a diminished excretion of urine believed to be due to an impairment in renal Oftentimes it is the first symptom of which the patient complains, and thus leads to the clinical recognition of the malady Those who have observed the condition know well the severe proportions which the edema may assume, the distress which it causes the patient, and the inadequacy of most therapeutic procedures in permanently controlling the condition

Since the time of Bright, explanations for the cause of edema have been manifold Indirectly they all attribute the phenomenon in one way or another to the retention of water and salts caused by the mability of the kidneys The position of to eliminate them adequately the kidneys in the body economy, however, is such that alterations in renal function may result from causes outside of them, so that retention of salts and water and the consequent edema may be due to factors other than renal insufficiency It seems self-evident that no massive effusion or edema can occur without a corresponding retention of fluid, but the cause of the retention need not reside in the

In 1917 10 I proposed the view that the edema in the disease under discussion was of extrarenal origin, directly traceable to loss of protein sustained by the blood in consequence of The arguments presented the albuminuria were based upon two precepts which now constitute well-established principles in the physiology of fluid regulation in the body, namely, intracapillary pressure and osmotic pressure

This hypothesis has received support from

many different sources It is hardly necessary In the uncomplicated to enumerate them cases the evidence is quite direct, and striking support is gained from the therapeutic procedures based upon the suggested hypotheses -procedures which aim to restore the protein content of the blood to normal In complicated cases (those associated with vascular changes or with renal disease) other factors undoubtedly play a part in the production of this phenomenon

In discussing the clinical character of the malady it was observed above, that it is of slow and insidious onset and that the edema is often its earliest symptom. This of course does not signify that the edema marks the beginning of the disease Much of the confusion concerning the pathogenesis of diabetes albuminuricus, I believe, is due to a misunderstanding of the origin of the edema. Its presence is usually interpreted in terms of renal insufficiency, particularly where it appears to be ushered in by an intercurrent renal inflammation In point of fact the presence of the edema, as explained, indicates an advanced stage in the development of the malady shows that the albuminuria has been of sufficient intensity and duration to bring the protein content of the blood to a pathological level

The protein content of the blood serum in such instances shows a moderate reduction below the normal At a later stage in the disease the edema makes a definite appearance, but is not constant. It may be observed either in the face or back when the patient is in a recumbent position, or in the lower extremities when the patient is up and about occurs when the protein content of the blood serum has been reduced to such a level that a critical point in the exchange of fluids between the blood and the tissues has been reached, and factors of gravity may disturb the balance and thus determine the formation and localization of the edema. It is found at this stage that the blood protein content is still close to 60 gms per 100 cc When, however, the protein content of the serum falls to about 5 gms or lower the edema becomes generalized and is permanent Posture alone no longer determines its presence or location In the absence of vascular disturbances, cardiac or hepatic diseases, or inflammation of the kidneys (glomerulitis or glomerulonephritis), the critical point in respect to the blood serum proteins, that is, the point at which the edema becomes a constant symptom of the disease. is approximately 5 gms per 100 cc. It is important to remember that the reduction in the content of the blood serum proteins is not due to hydremia or blood dilution

Thus, in view of the fact that the edema is largely, if not entirely, the result of a loss of protein from the blood, it may be regarded as being virtually a sequel of the albuminuria It is by virtue of the fact that the edema in this disease is of extra-renal origin that diuretics are of no avail whatever

ETIOLOGY

The exact nature of the initial disturbance which leads to the albuminuria is still an open question Close analysis favors the view that the fundamental cause is a metabolic perversion in which the blood proteins undergo either a physico-chemical or a biologic change, and cease to function properly Like other metabolic diseases, this one also shows certain predilections, and may be provoked by a variety of extraneous causes It occurs most often in young adults and children, and is more common in males than in females The individuals particularly prone to this malady are of a peculiar flabby type, some being definitely obese at the onset. The occurrence of repeated attacks of urticaria mark the early history of some of the cases In certain instances glycosuria may accompany the albuminuria, and a tendency to albumosuria has also been ob-While in most instances the disease begins insidiously, occasionally it is ushered in by an infection, or it may occur during or after pregnancy, or in the course of some endocrine disturbance Nor can it be said with certainty that syphilis or tuberculosis, when present, are the direct etiologic factors of this The various conditions enumerated cannot be regarded per se as the etiologic factors, they are merely the exciting causes

From clinical and biochemical observations, it seems probable that the function of the thyroid is also in some way concerned in the abnormal metabolic phenomena present in diabetes albuminurious or chronic nephrosis But the relation is not, as might be supposed, generic, for, while myxedema and diabetes albuminuricus have certain features in common, the relation of the thyroid gland to these diseases is fundamentally different Hypothyroidism and myvedema are the result of a deficiency in thyroid secretion, varying in degree The relation of the thyroid to these conditions is therefore causal or generic. There is however no evidence to show that the thyroid gland is diseased in diabetes albuminurious or so-called chronic nephrosis, or that its function is subnormal, and experience indicates that the amount of thyroid substance required to restore the metabolism in cases of diabetes albuminuricus to normal is very much greater than in complete myxedema While superficially the difference in the behavior of myvedema and diabetes albuminurious in relation to thyroid is quantitative only, the metabolic disturbance in this disease must be of a somewhat different nature and much more profound in character. When measured in terms of thyroid requirement, the disturbance is even greater than that represented by the total cessation of thyroid secretion. Diabetes albuminuricus does not represent a simple deficiency of thyroid, but a condition in which the latter fails to attain its normal stimulating effect upon the metabolism of the cells, either as a result of a peculiar resistance on the part of the cells themselves or because of the chemical change in the composition of the blood.

This conception of chronic nephrosis reduces the subject to simple terms by means of which the clinical manifestations and pathologic changes can be readily understood foregoing exposition an attempt has been made to show that most of the clinical manifestations of so-called chronic nephrosis are traceable to a condition which is not renal in origin or na-Upon this interpretation of the disease depend two very important questions, namely, the prognosis and the treatment Most true renal diseases which run a chronic course are progressive in character and ultimately prove fatal, the disease which I have described and termed diabetes albuminurious is not renal in character and therefore by its very nature affords a totally different outlook. Notwithstanding the fact that its etiology is uncertain and its duration is usually long it is nevertheless capable of complete cure, when therapeutic measures are instituted which are in keeping with the principles that I have sought to establish

TREATMENT

The basic disturbance of the disease is a subversion of protein metabolism. The albuminuma, the loss of protein substance from the blood, the edema, the lipoidemia, the reduced basal metabolism and other evidences of tissue starvation, all result from this basic disturbance. The problem in the treatment of diabetes albuminumicus therefore resolves itself into three specific propositions.

- 1 To replace the protein loss of the blood plasma. This is best accomplished by feeding a high protein diet, that is, 20 to 30 grams of protein per kilogram of body weight.
- 2 To compel the tissues to utilize the protein and incidentally to reduce the lipoidemia This, too, is often accomplished by a liberal protein, but fat-poor diet. The administration of thyroid aids in attaining this desideratum
- 3 To re-establish normal metabolism When high protein feeding fails to accomplish this the institution of thyroid is definitely indicated. It must be remembered that the main purpose in the use of thyroid is to stimulate protein utilization. It does not aim to replace protein

feeding which is fundamental in the treatment of this disease

The dietary rules are simple Two to three grams of protein per kilogram of the observed body weight are allowed Fats are largely, and whenever possible, entirely excluded This necessarily makes the diet of low caloric value Fluids and salt are allowed in moderation and not reduced to an intolerable minimum

Further details concerning the diet seem hardly necessary at this time. A few remarks on the use of thyroid however are in place, particularly because the position which this agent occupies in relation to diabetes albuminuricus is unique.

As is well known, thyroid extract has been used in a variety of conditions, notably cardiac and renal diseases associated with dropsy For the most part its earlier use was based entirely on empiricism and consequently failed to attain any great importance. In 1917, however, Eppinger made a more systematic study of the subject 11 His use of thyroid, however, had a limited application for he employed it only in cases in which the edema did not yield to diuretic measures, and forbade its use if the response was not prompt The object sought The dosage which he was diuretic action recommended as we shall see later on was far too small to be of any definite or permanent I state these facts because while Eppinger's conception of the therapeutic application of thyroid in the treatment of various edemas had some clinical foundation, he failed to realize the true function and the value of thyroid in the treatment of this particular

The purpose in the use of thyroid, as stated above, is solely to accelerate metabolism and promote the utilization of protein In 1926,12 I called attention to the enormous tolerance which patients with diabetes albuminurious show for thyroid substance or its active prin-While the amount of thyroid ciple, thyroxin necessary to re-establish normal metabolic conditions in myxedema is relatively small, I have found that in diabetes albuminurious the amount of thyroid or thyroxin necessary to produce a therapeutic effect is most extraordinary For example, daily doses of from 10 to 40 grams of thyroid are often required over long periods of time to elicit a metabolic response

The method used in the administration of thyroid and thyroxin is as follows. When the preliminary high protein feeding fails to give any therapeutic result, such as elimination of the edema, control of the albuminuria, and change in the chemical composition of the blood, the use of thyroid is begun. The initial dose is usually small, from 0.03 to 0.65 gms three times a day. In many instances this dose

may be sufficient to enhance the effect of the high protein diet in attaining its therapeutic success As a rule, however, much larger doses are needed. The amount of thyroid is therefore rapidly increased until a daily dose of 1 gm is reached. If such a dose fails to give any indication of effectiveness, it is immediately doubled and administered for from five to seven days If this in turn does not give therapeutic results, the use of thyroxin is resorted to It is given intravenously, the initial does being from 5 to 10 mgms This dose may be repeated at intervals of from five to ten days until definite effects are observed The beneficial effect is indicated by increased diuresis, diminution in the albumin output and decrease in the While increase in pulse rate and lipoidemia elevation of temperature occasionally follow the use of thyroxin, no toxic symptoms develop

as long as the lipoidemia persists

The oral administration of thyroid in large doses occasionally causes gastric distress, such as anorexia and nausea; and in such cases the use of thyroxin is resorted to at once along the lines outlined above As soon, however, as therapeutic results are evidenced, the dose of thyroid and thyroxin is reduced, the main guide being the lipoidemia It is a very comforting fact that thyrotoxic symptoms have not been observed by me thus far, in spite of the enormous doses of thyroid and thyroxin used, a fact which would seem to indicate that there are not likely to be any untoward symptoms prior to a favorable turn in the clinical course The symptomatology of diaof the disease betes albuminurious is so closely interwoven with its biochemistry that whatever modifies its chemism in the right direction relieves its symptoms, and improves the condition Thus by virtue of a common attribute-stimulation of protein metabolism—beneficial results follow high protein feeding, thyroid administration and occasionally even fever It must be remembered, however, that relief of symptoms and improvement alone are not the sole objects of the treatment of diabetes albuminuricus Experience teaches that uncomplicated cases are susceptible of complete cure by the intelligent and persistent use of the high protein diet and thyroid therapy. It must be remembered, however, that six months to two years may be necessary to accomplish this result

The presence of complications not only alters the outlook, but necessitates modifications of the therapeutic procedures. The commonest accident is infection, in which the pneumococcus is the chief offender. The biochemical changes which take place in diabetes albuminuricus seem to render the conditions particularly favorable for the invasion and development of this micro-organism. The seat of the

infection is variable sinustitis, otitis media without and with mastoiditis and sinus thrombosis, pneumonia, erysipelas and thrombophlebitis of the extremities have been observed, but the peritoneal cavity is most commonly While such infections are of grave portent, they are not all fatal Among others I have seen three cases of pneumococcus peritonitis recover spontaneously, and a fourth, simulating acute appendicitis was operated upon and recovered after the laparotomy

Infections in other localities run a course which is not unlike that encountered in other conditions The outcome depends on the severity of the infection Occasionally the effect of an infection is rather favorable. As pointed out before, the influence of the associated pyrevia upon the general metabolism is such as to accelerate protein utilization, which high protein feeding and thyroid administration This suggests sometimes fail to accomplish the possibility that other pyrogenic substances may be of service to initiate the metabolic changes desired in this condition This, however, is a problem for the future

The complication which gives the greatest amount of concern is a true inflammatory disease of the kidneys, glomerulonephritis Here the treatment becomes complex On the one hand efforts must be made to replenish the blood protein, on the other, a rising azotemia must often be combatted Under these circumstances the azotemia should receive first consideration and a low protein diet must be fed until the accumulation of waste products in the blood is adequately overcome. The presence of edema under the circumstances mentioned serves as an aid in overcoming the to\ic effects of the azotemia Removal of fluid accumulated under the skin or in the serous cavities is desirable but when it is not possible to accomplish this by way of the kidneys through diuresis, puncture and drainage should be resorted to When the azotemia is reduced, the protein intake may be increased to a point which is in keeping with the requirements of the body and the functional capacity of the

Other symptoms arising from a complicating nephritis should be treated in the usual manner and according to indication Diabetes albuminuricus per se, as stated before, is not accompanied by changes in the cardiovascular system Consequently elevation of blood pressure which persists or progressively increases

must be regarded with suspicion

There is one other group of cases to which special attention must be called and in which two distinct sets of therapeutic indications ex-The ultimate outcome of these cases depends on the order in which the indications are I refer here to the cases of diabetes al-

buminuricus with a history of syphilis or in which a positive Wassermann reaction is ob-It will be recalled that Munk in discussing "lipoid nephrosis" ascribed the etiology of many of his cases to syphilis. I have encountered only three cases of diabetes albuminurious with a syphilitic history and a positive Wassermann reaction. My experience with them indicates that the diabetes albuminurious under such circumstances can be an independent condition and may have nothing to do with the syphilis Attempts to treat the syphilis in the above cases resulted in marked aggravations of the other condition The usual therapeutic procedures were therefore used, namely, high protein feeding and thyroid, and the patients made a complete recovery from the diabetes albuminuricus

The intervention of a nephritis in the course of diabetes albuminurious which progresses to fibrosis and contraction of the kidneys modifies the course of the disease in a very interesting and enlightening manner The clinical manifestations which have been described as being "nephrotic" in character (that is the intense albuminuria, the reduction in the total blood serum protein, the inversion of the albuminglobulin ratio, the lipoidemia, the edema, and the oliguria) all retrogress. The albuminuria recedes and in consequence of this, the blood proteins are gradually conserved Following the conservation of the blood proteins, the inversion of the albumin-globulin ratio also recedes and ultimately assumes approximately The lipoidemia also follows normal values suit and is gradually reduced to a normal or subnormal level Polyuria replaces the oliguria and the edema subsides This course of events, I believe, constitutes a striking illustration of the interdependence of the clinical phenomena in diabetes albuminurious and the albuminuria

THE TRADITION OF MEDICINE*

By FREDERICK T van BEUREN, JR, MD, NEW YORK, NY

Noccasions such as this when Teaching Staff and students reassemble at the opening of College the mind is struck anew by the instant meeting of Past and Future in the Present Memories of the one and visions of the other speak insistently in the glance of faces new and old among this pleasant assemblage. Thoughts run far ahead of words and a quiet thrill of satisfaction pervades the heart in recognition of those outward symbols that signal the continuance of a great Tradition.

The basic significance of this word Tradition is so different from its common usage that it requires for a moment to be emphasized the hurley burley of modern life, Traditions have come to be looked upon as something in the nature of old wives' tales But in origin and essence the word Tradition implies a giving over of knowledge, of beliefs, of customs and of usages from one age to another. It is at times a process so subtle that it passes unperceived Again, on occasions like the present, it is formalized by procedure, given voice in an Address of Greeting and colored by the sober brilliance of academic dress But always, recognized or not, it is marked by a blending of the Past and Future, a joining of visible hands to those invisible, a linking of thought that has been to thought that is yet to come, a general investiture - as it were - of those assembled, into the spiritual garment of a fellowship which includes men who have already lived and men who are yet unborn. It marks, for the moment at least, a spiritual unity rising from a common desire and energized by a common purpose And, in its periodical recurrence, you may think of it - if you like - as symbolizing a rebirth in one generation of the ideals that have actuated their predecessors. It is in fact an unspoken recognition of something immortal among mortal men That something, a spiritual essence which animated our Fathers in Medicine and which through us they are transmitting down the ages of medical generations like a torch passed from hand to hand You younger men and women among us are in this special sense the torch bearers of the The profession of Medicine will wax or wane with the light you throw upon its path

Viewed from this angle the Tradition of Medicine is a great tradition. For it implies a giving over, from one generation to another, not only of Knowledge, beliefs and customs but above all a giving over of a spirit of good.

* Read at the opening of the College of Physicians and Sur geons, Columbia University, September 26 1928 will towards men which shall be a basis for the use of that knowledge and skill

The spirit of the Medical Profession is a spirit of service and the great tradition of medicine is a giving over of that spirit of service

Good Will and Service are nowadays much abused words. But we are using them in the older sense implied by that great man who said memorably two thousand years ago "do unto others as you would that they should do unto you". Moreover we use them with the same feeling that actuated the fancifully dressed people of a more elaborate period who coined the phrase "noblesse oblige". For there is a certain compelling quality in the true spirit of service

View with a critical eye and, if you like, from a sceptical angle, the life of a good practitioner of the Art of Medicine. You must conclude, if you are honest as well as intelligent that, while he may have to sell his time, knowledge and skill to make a living for his family, he invariably gives in a very real sense something of himself to his patients. Those who do not are not true practitioners.

You who are among us for the first time today may have thought of Medicine—or heard it spoken of—as a Noble Profession A little consideration will convince you that it is nothing noble in itself. It can in fact, like any other profession, be prostituted by base men. It can be made to serve the uses of the poisoner, the assassin and the criminal abortionist. It can still furnish a cloak for ignorance and sloth. Its powers can be perverted in a score of ways by an ill will and a mind given to disservice.

But this, upon the whole, it must be said is little done The profession of medicine does not attract in general men of evil intentions and of cruel instincts Its most outstanding feature is that preeminently it offers opportunity for the practice of Virtues rather than vices And such opportunities call loudest to men of courage and self-control, to kindly natures and to a love for truth and fair dealing It is men with qualities such as these, men who have the intelligence to distinguish between Right and Wrong by their effect upon human lives - and who prefer Right - that have given to Medicine its reputation for nobility True Medicine was founded by men who were so fortunate as to be born with a wish to leave this little world of ours a trifle better than they found it Men who, whether they knew Him or not, were fellows with that Great Physician of the Mind that said to the sick man "take up thy bed and walk" They

were fellows, too, with that fine old Greek who loved the truth so much he did not fear to seek it in the bottom of the Hemlock cup It is such Heroes of Medicine that have given a touch of nobility to the profession which began in priestcraft and wizardry ages and ages ago the profession which in the Dark Medieval World fell into the hands of Charlatans and Quacks And it was saved from destruction then only by the efforts of a comparative few whose character and intelligence stood out above their fellows men who had the courage of their convictions and were not withheld by selfishness nor restrained by fear

Those were the days when Medicine divorced Surgery and made of the latter its lackey and inferior But the Guild of Surgeons finally broke from its humble place among the barbers not because its members were more handy with the knife and shears but because they had more intelligence, more daring, more self-discipline and more devotion than their tonsorial confreres Read of the work and the lives of de Mondeville, of Guy de Chauliac and of Ambroise Paré They are typical doubtless of a hundred others, lesser known, who fought a finally triumphant battle against greed, ignorance, prejudice and superstition Never was medical progress so beset by foes and never had it sturdier champions than in those dark years Yes! and in the brighter centuries following when our civilization was emerging from a now almost forgotten era of intellectual poverty into which it had been ridden by Priest and Noble and driven by Pestilence and War Even in the better times later on when heresy was no longer greeted by faggots around a stake it took courage and faith to proclaim and forward the truth Think of Pasteur, that great friend of Medical Science, fighting the fallacy of spontaneous generation in his efforts to establish recognition of the bacterial causes of disease. Working long hours against personal misfortune, poverty and ill health, working in cellar or garret and upon the lonely hilltops only for the truth's sake and for his studied convictions Modest and unpretending for himself, "Worship great men," said he -- little thinking that he would one day be counted among the greatest

Think too—hardly fifty years ago—of Lister, the follower of Theodoric and de Mondeville, the brave, quiet, kindly persistent Scotchman who brought the gift of surgical cleanliness to the world and helped to conquer infection. Think of him bringing it to a world whose hospital patients were decimated by erysipelas and gangrene, a world which so greatly knew the need of help against puerperal infection that it had, in its book of common prayer, included a special supplication for "Women in the perils of childbirth". And think how the

world met him — his own Medical World even He was crucified by ridicule, pilloried by slander and mercilessly assailed by men unworthy to sit at his feet. We think now of Lister as a wonderful man, honored by his colleagues and ennobled by his sovereign. But read in the papers and periodicals of his own time how he had to fight against odds for his final victory.

Think again of the introduction of the anesthetic use of ether. Read in the accounts of that day the storm of protest and criticism that arose and buffetted the men who sought to ease the sufferings of humanity.

The world has changed a little since those days. The mighty net of electrical communication has sifted information like a great powder shaker over the whole face of the globe. We have now to fear rather the blindness of over-irradiation than that of too little light. Discoveries are no longer greeted by denials and humiliations but rather by academic honors and material rewards. Yet we have need today for the same basic virtues of courage and loyalty, of gentleness and patience, of intelligence and industry, of honesty and a steadfast purpose

We have come but a little distance along the road of progress against disease and we have still a long, long way to go. We have learned how to combat some of the ills of the body but the ills of the mind are just beginning to be recognized as worthy of intelligent attention A pitiful many still squander their pence upon nostrums and quacks. The best beloved of many a family is still snatched from our hands by the Old Enemy Death in spite of our best efforts with our present Knowledge.

The fields of surgery, of psychiatry, of chemotherapy, of serology and of preventive medicine are opening up wider spaces for exploration by those patient workers in Lilliputia who start upon their travels clad in Laboratory smocks instead of shooting suits and are equipped with microscope and test tube instead of field glass and rifle

There is more room at the top than ever before, for we have begun to reach that part of the tree of Medical Knowledge where the branches spread out widest.

This College of ours has waxed great in wealth and reputation. It has enlarged monstrously in size. Its original home of more than a century ago could be housed in a half of one of our sixteen floors. Our teaching staff has grown from less than ten to more than three hundred. We have five or ten times as many applicants as we can admit. Our student body has been multiplied by more than a hundred. The College sends out its graduates five score strong from year to year

It is known throughout the six continents and the seven seas

But how is it known—and why? Is it known as a wealthy aristocrat, proud of its claim to priority in age over other Schools of Medicine in America today? Or is it known as a kindly Alma Mater, loyal to the worthy sons it sends out into the service of the world and jealous, in the best sense, to guard their ideals of service and to see them forward in their ministry of Science and of Mercy? Is it known because its buildings tower towards the sky, "a wonder in the sunshine, seen afar?" Or is it known because the good will of its sons and servants has wakened memories of affection in the hearts of those whom they have served?

This College of Physicians and Surgeons is not a group of buildings with wide spaces and high walls It is rather a community of human beings working together with a common purpose, in mutual helpfulness and friendly Are we who make up this College we students, graduate or undergraduate, we students of the Present and the Future-holding fast to the Spirit of our Fathers in Medicine? Are we examplaring the creed of Hippocrates with whom we still make oath at Graduation? Are we keeping bright the memory of Galen, great theorist and great experi-Are we recalling to some useful purpose the rough honesty of Hugh and Theodoric, the persistent courage of Lister and Pasteur?

Are we even filling the shoes of our forbears in our own College? Are we advancing on the footsteps of our Samuel Bard, of David Hosack, of Nicholas Romayne, of Willard Parker, Valentine Mott, Alonzo Clark and John Dalton, great men in the early history of our own School? Do we remember if not commemorate the sacrifice of our own graduate, Jesse Lazear, who found death in helping to save thousands from the Yellow Jack? Do we think often enough of those dear masters, friends and fellows, recently gone from our midst, of Delafield, of Prudden, of Janeway and of Huntington?

They at least had it, that fine spirit of endeavor, and we must ask ourselves whether we have it still to lead us on, not into larger buildings but into greater service

These questions can be answered only by our lives. History may or may not record the final answer. But there is no cause for downcast looks and solemn consultations. Funereal faces are unwelcome at the bedside. This is no post mortem inquiry but a very lively and pertinent questionnaire such as endeared old Socrates so questionably to his Athenian formats.

At least we can say the signs are good and

the omens favorable For I know a dozen men, students and instructors both, in this very College, who are cheerfully ignoring their own pains and infirmities in striving to lighten those of others Would you desire better evidence of a courageous spirit?

We must not ask too much We cannot all be Heroes We are not all cast in the mold of statuary bronze But there is no cause for heartburning or despondency, no reason for disappointment or ill ease if a man fail to win the plaudits of the crowd and receive the world's acclaim Worthy of equal respect is every man who does his best whether he carries the smallest burden of the world or strides along with a whole nation on his back only he has done his best, if only he has tried and tried again, if he has helped some weaker soul along the road and cast no envious glances at those faster in the race, each will receive an equal prize, Contentment! And whether this be served simply, upon a dish of leaves, or on a gilded salver to the music of hautboy and flute, it sits equally warm beneath

You younger people into whose hands symbolically we place today the books of Knowledge and the instruments of our craft you who will bear the torch to generations yet to come, open your hearts and minds to the spirit of our profession—to the best essence of it—that we are fain to have poured into them And not by exhortations only-for example speaks far more persuasively to the mind than precepts to the ear "Worship Great Men," said Pasteur I think he meant to emulate them, for this sort of imitation is indeed the sincerest flattery Choose each of you some great man to model yourself upon not their speech and manner but their spirit and ac-If theirs were truly great it will help you to imitate them If they were great only in your minds, you will still be the gainers, for you will come to recognize the ideals you thought to have from them as being in reality your own

Look for the good in mankind Cherish courage and kindness wherever you find them and share your own with others Practice self-control—and do not be discouraged by failure in it Self-control is the highest power of the human mind—an absolute necessity for physician and surgeon and difficult to achieve It is worthy of much cultivation in spite of the present tendency so aptly outlined in the title of that very popular song, "Express Yourself My Child"

You who are here today as students will remain or return one day here, or elsewhere, as masters Keep this in mind and avoid arrogance "I make the wound," said the Wise Paré, "God heals it" Remember that your

responsibility is at least equal to your

opportunity

Now that you are in Medicine you cannot live unto yourselves alone Each one of you has in his hands the reputation of the profession to brighten or to tarnish. Five, ten or twenty years will see most of us who are now in this faculty absent from our accustomed places. But this College will continue to grow and its influence to spread spiritually, intellectually and physically for the benefit of

mankind if you will it so to do The Future is far more in your hands than in ours

Physicians of the future, we who are (in this sense) about to die, salute you We cheer you forward with confidence in our hearts. Our minds are tranquil in the hope and the belief that what we shall have to leave undone will be done by you and whatever we have done well will be better done by those into whose care the great tradition of Medicine is now passing

ANALYSIS OF MEDICAL AND BLOOD EXAMINATIONS OF AUTOMOBILE REFINISHERS IN NEW YORK CITY*

By JEROME MEYERS, MD, NEW YORK, N Y

THE automobile refinishers examined by Dr Leo Tobias and the writer numbered 96 These embraced 14 sprayers, 50 painters, 4 metal workers, 7 woodworkers, 4 body builders or hands, 13 trimmers and 4 finishers Clinically they may be divided into two groups I those exposed to spray—77, II those not exposed—19

In a survey of the clinical and laboratory findings and an estimate of their medical and industrial significance, consideration of the blood constitution of these 96 men and in the separate groups is of first importance, as these workers in large part report that they are exposed either by inhalation or contact to chemicals, such as lead, turpentine, naphtha, methyl alcohol, amyl acetate, banana oil, benzol, toluol, and other volatile agents, which may in some degree or manner affect the components of the blood In each case therefore a complete blood count, hemoglobin, and differential were done by Dr Ada Reid, all specimens being from the finger Following the standards of the National Safety Council,1 hemoglobin under 70%, while blood cells 5600 or under, or 11,000 and over, or total polynuclears under 4,000, are listed as abnormal, as are lymphocytes under 30% or over 40% a criterion of disordered blood picture in this study a polynuclear content under 4,000 was utilized

On this basis there were found in group I is among the 77 exposed to spraying, either directly or at a distance, 48 cases showing total polynuclears under 4,000, or 62 2%. If we take as a basis a total white count of 5600 or under as a standard, 25 9% showed a blood disturbance. In addition, there were 11 in which the total leucocytes were 11,000 or over, a finding of interest, as in mild or early benzol poisoning, increase in the white or red cells

may occur 2 It must be remembered, however, that naso-pharyngeal disturbances, which are apt to occur in such a group, may raise the number of white cells Only 4 showed a hemoglobin under 70% and 5 a red cell count under 3,500,000, the lowest being 3,300,000 The lymphoctyes were abnormal in 30 cases, or in 40%, in all of which, except 3, there is a distinct increase over the 40% mark, some being as high as 50, 56 and 57%, showing a very distinct lymphocytosis in 27 cases or 351% group II, those reporting that they were not exposed to fumes, of 17 with complete blood examination, 5 or 293% showed total polynuclears under 4,000 Of these 17, there were 14 painters, 3 of whom, or 21 4% showed blood abnormality, and 2 finishers (painters) both of whom were abnormal

An analysis (Table I) of those exposed to fumes and showing under 4,000 polynuclears

TABLE 1

Number and Percentages of Those Exposed to Fumes *
With abnormal blood, under 4,000 polynuclears
With normal blood, over 4,000 polynuclears

		Abno	rmal	Normal	
	Total No	No	%	No	%

Sprayers	13	10	76.9	3	23 1
Other tra	des 22	17	76.2	5	23.8

^{*} Cases with whites of 11,00 or over not included

by trades shows the following of 31 painters, 21 or 678% showed a blood abnormality, of 13 sprayers, 10 or 769% and of 27 other workers, 22 or 81 5% This is excluding entirely 11 cases with total white counts of 11,000 or In this study less than 4,000 polynuclears has been the basis of blood disturbance. but under ordinary clinical conditions and also possibly with early benzol effects such high counts would not be considered normal we add the 11 cases to the normal ones, the 36 painters show 58 3% of blood abnormality. the 14 sprayers 71 4% and 27 other workers. If the 11 cases are considered ab-61 9%

^o This study was made by the Division of Industrial Hygiene Department of Health City of New York, at the request of and in cooperation with the United Automobile, Aircraft and Vehicle Workers Union, Local No 49

normal, they would raise considerably the incidence of blood disturbance. It is interesting here to remark that in only 2 of these 11 cases of high white counts were there any subjective complaints.

An analysis of the subjective symptoms of dizziness, headache, nausea, or constipation which might point to benzol or lead effects, gives among the 48 belonging to group I abnormal cases, 13 complaints of dizziness, or 27%, 6 or 125% of nausea, 6 or 125% of constipation and 24 or 50% of headaches. Of the 48 cases, 27 or 562%, have one or more of the complaints, 8 reporting as many as three

A further analysis (Table 2) of the 77 cases exposed to fumes, showing the comparative

Table 2

Number and Percentages of Subjective Complaints (Headaches, Dissumess, Nausea) in Exposed Cases * With blood abnormal, under 4000 normal over 4000

	A	bnormal	Normal		
		Men with		Men with	
	No	Complaints	No	Complaints	
Painters	21	12 or 57 1%	10	0	
Sprayers	10	5 or 50 %	3	0	
Other trades	17	8 or 47 1%	- 5	0	

^{*} Cases with whites of 11,000 or over not included.

incidence between the normal and abnormal cases, gives 10 painters normal of which none had complaints, 21 abnormal of which 12 or 57 1% had complaints, 3 sprayers normal with no complaints, 10 sprayers abnormal with 5 or 50% complaining, and 22 other workers, of whom 5 were normal without complaints, and 17 abnormal of which 8 or 27 1% had complaints Counts of 11,000 whites or over are not here included but if they should be, they are all negative as to complaints as was noted above

In group II, those unexposed, of 11 men with normal blood, 7 or 63 6% give the usual symptoms Of 5 with abnormal blood 60% had no complaints, and 1 with complaints was an old luctic

Of the medical findings indicative of systemic disturbance group I of 77 exposed cases showed 35 cases or 45 4% with defective vision, group II of 19 unexposed, 11 or 52 6%, with conjunctivitis, 4 or 52%, against 1 or 53%, with pharyngitis, 36 or 48 1%, against 5 or 21% with nose deformities and obstruction, 12 or 15 6%, and 1 or 5 3%, gingivitis and pyorrhea, 26 or 33 8% and 1 or 5 3%, mitral endocarditis, 4 or 5 2% against nothing, arteriosclerosis, 3 or 3 9% systolic blood pressure, 15 m above normal, 5 or 65%, 15 m below, 3 or 3 9%, all against nothing in group II, enlarged liver, 3 or 3 9% and 4 or 21%, skin conditions, 14 or 18 1% against 2 or 10 5%, bronchitis, emphysema and asthma,

11 or 142% and 3 or 158%, reflexes—diminished, missing or exaggerated—10 or 13%, and 5 or 263%, pallor and emaciated appearance, 12 or 156%, against 105%. Of these findings conjunctivitis, pharyngitis, nasal obstruction and rhinitis showed distinctly large incidence, but greater in the exposed. The same applies to gingivitis, and anomalies of blood pressure. Bronchitis, emphysema and asthma are high in both groups. Skin conditions are high, but they are in no wise hæmorrhagic in origin, or character, and would seem to be of no importance, being mostly acne. The above findings are indicative of local irritation of the nasal pharyngeal and pulmonary systems.

There was found evidence of lead poisoning in 9 men, 7 of whom were painters and 2 nonpainters but exposed to the spray machine (1 trimmer and 1 body-builder), 3 of the 9 have had the medical and laboratory findings corroborated by an analysis of a 24 hour specimen of urine for lead, the amounts showing 13 mg of lead per liter, 1,053 and 44 according to the Fairhall method One 24-hour specimen was negative for lead Six of the 9 showed stippling of the red blood cells and in 5 of these 6 cases no 24-hour specimen has been taken up to the present time 13 of the 20 shops reported the use of only wet sandpaper-Of these 11 used water only and 2 used water and gasoline The remaining 7 shops used both wet and dry methods

A survey of the length of exposure among the sprayers shows that of 11 abnormal the time varies from 2 months to 5 years. Three exposed only 2, 6 and 7 months are under 4,000 polynuclears On the other hand, 1 normal has a 5 year exposure. Among the 7 painters with normal blood, the exposure is 3 weeks, 4 months, 2 weeks, 18 months, 5 years, 3 years, 5 months Among the abnormal painters, the time is 3 months, 8 months, 4 months, 3 months, but most of them 2, 4, 5, 6 years Among other crafts, the normals show 15 months, 2 years, 4 months, 4 months, 2 years, 4 years, 6 years, while among the abnormal we have 4 months, 2 years, 2½ years, 4 months, 5 years, 5 years, 3½ years, 10 months It would seem that more abnormal conditions are found with greater length of exposure, but there are numbers of abnormal bloods even with short exposure Individual susceptibility plays a considerable role

It is also of interest medically that of 27 shops represented by the men examined, spraying was done in closed rooms in 9, or 33 3%, on the open floor in 5 or 18 5%, in rooms and on floor in 8 or 29 6%, making 48 4% of the shops where spraying was done wholly or partly in the open. In 20 shops or 74% there was said to be escaping odor, the ven-

tilation was reported good in only 4 or 148%, fair in 11 or 407%, and poor in 3 or 111%

Finally we may note that the chemical examination of 10 specimens showed that five of the lacquers and one filler and surfacer contained considerable amounts of benzol, ranging from 6 to 25%

Comment

We are dealing with a group of 96 men of heterogeneous crafts in the automobile refinishing industry, all of whom are liable to exposure to benzol, lead and other chemical The harmful effect of benzol on the blood has been investigated for some years The Committee on Benzol of the National Safety Council,3 investigating chemical and rubber plants, reported that benzol poisoning may proceed for considerable time with marked blood changes with very few symptoms They reported 25 positive blood findings among 81 workers in rooms with average benzol contents ranging from 70 to 1800 ppm using 5625 leucocytes and a lymphocytosis as a basis for benzol poisoning The factor of personal susceptibility is stressed Even benzol below 100 ppm except in closed systems, is considered dangerous Masks are found mefficient results of the Spray Committee of the National Safety Council, in its investigation of 160 lacquer sprayers in different automobile or body plants showed 15, 5, and 9% of benzol in lacquers in one plant Benzol in air in 5 plants showed 375-1880 ppm Two low exposure plants (lacquers used supposedly free from benzol) are compared with four high exposure ones In the high ones twice as many complaints (dizziness, constipation, dyspnoea) The proportion of these complaints showed increase with length of service, and there was much more white cell disturbance "Taking the benzol The report continues committee limit of 5625 white cells as a dividing line, only one man out of 69 in the low exposure plants fell below standard while in the high exposure plants 19 out of 91 men examined gave a disturbed blood picture Only one out of 69 in the low gave a picture of benzol poisoning, while 7 out of 91 in the high A study by myself of Table I in this report showing blood examinations of 155 lacquer sprayers shows that in 64 or 41 3% there was a polymorphonuclear count of under 4,000 However in the summary in the body of the report no mention is made of this finding

On the basis of 5625 leucocytes, the Benzol Committee's positive findings are 321%, the Spray Committee in the lacquer workers in the automobile plants 208%, and the present

investigation it is 259%

Using 4,000 polynuclears or under as a standard the present study would indicate a very large percentage, 628%, of blood disturbance as found in benzol poisoning, in a mixed group Also the component groups of exposed men show high incidence. By one method of estimation, the sprayers show 769%, the painters 67.8%, the other crafts 76.2%, by another method, sprayers 71 4%, painters 58 3%, other trades 61 9% The sprayers are the highest but the other two classes are distinctly affected

That this condition is due to the spread of fumes to non-sprayers is possible Air analyses for benzol in shops under working conditions would be very valuable and enlighten-Also of 17 workers reporting non-exposure to spray, 5 painters showed polynuclears under 4.000 None of the 17 however showed white cells under 5625 It is interesting to note that of 77 painters examined in 1923 by the Workers' Health Bureau, who were not exposed to spray effects, no total white counts were under 5625, 9 or 11% were over 11,000 and 7 or 91% were under 4000 This is of interest compared polynuclears with the painters of the present group which shows far greater blood abnormalities has been a general hazard in more recent years It is also of interest in showing that in a group of 77 men not exposed, 9 show white counts over 11,000 and 7 polynuclears under 4.000 The writer feels that the best method of observing blood impairment would be to have each worker on entering the industry undergo a complete blood examination to determine his normal blood constitution tain forms of chronic tuberculosis, certain thyroid conditions, those with a lymphatic diathesis, lues and vagotonia, may give low white counts with a lymphocytosis which might render the polynuclear count low without exposure to benzol

It is of interest to note here that on re-axamination of blood of 17 men, 4 showed an increase of approximately 4000 white cells as compared with their first counts, and 4 would be classed as over 4000 polynuclears, that is, 23.4% of the total 17 change to the normal column

In spite of the high percentage of positive blood counts the men showed no grave medical evidence of benzol poisoning, a finding corresponding with that of the Benzol Committee As far as subjective symptoms of headache, dizziness and nausea are concerned, we find a more definite relation to toxicity, as in 10 painters, 3 sprayers and 5 of other trades, all normal, there were no complaints also no doubt that benzol is in use in some lacquers in the shops as evidenced by the present study There is also sufficient evidence that many shops are deficient in ventilating systems, careless in not keeping the doors of

the spray rooms shut, and spraying in the open

This study, therefore, shows a high percentage of blood abnormalities, indicating benzol effects, a percentage considerably higher than in other studies on benzol It would seem from the above considerations more conservative and be of greater comparative value in the light of the findings of the Benzol Committee and the Spray Committee to use a leucocyte count under 5600 as the standard for abnormality As pointed out above this would give evidence of benzol effects of 321% and 208% against 259% in this study We are dealing with groups exposed to hazards so far not widely investigated That considerable hazard exists is evident, that protection from continued benzol effects which may later precipitate serious symptoms, is indicated Such protection should be industrial, through installation of proper - ventilation, should be preventable, by continued medical observation of the workers, and prophylactic, by medical examination on entrance to this trade, so that normal physical and blood conditions may be known and periodically investigated

The following medical recommendations are made

- 1 A thorough physical examination on entrance to the trade
- 2 A complete blood examination to determine individual norms
- 3 Complete periodic examinations every three months
- 4 No worker should do spraying with paints or lacquers containing lead or benzol if he have symptoms and physical findings distinctly referable to lead or benzol, or if he have suspicious symptoms with a 25% reduction of red blood cells or a white count under 5600, with further blood examinations showing progressive reduction. When the original blood condition of each worker will be established, declining counts will immediately arouse suspicions of toxic influences.
- 5 Tuberculosis, suspected tuberculosis, chronic bronchitis, asthma, myocardial and valvular disease, nephritis or any blood dyscrasia, should exclude

THE PATHOLOGY OF THE AGING PROCESS

By ALDRED SCOTT WARTHIN, Ph.D. M.D. LLD

Professor of Pathology and Director of the Pathological Laboratories in the University of Michigan Ann Arbor

Delivered on October 1, 1928 as the Weslev M Carpenter Lecture on the first day of the Graduate Fortnight of the New York Academy of Medicine and published also in the October Bulletin of the New York Academy of Vedicine

TN the very heyday of man's powers, in the full summer of his creative possibilities, and of his desires and ambitions, the life-drama played by each human actor discloses, quite suddenly and unexpectedly, its real tragicomic motive It is, as if the player himself, had been enacting a part in a drama, the course and the end of which he did not fully comprehend had been a pleasant play of exciting incident, joyous adventure, vital desire and satisfaction, ambition and achievement The actor has wantoned with his rôle to his own satisfaction, and now, well past the middle of the second act, he is shocked by a sharp hint from the prompter's box that his interpretation of his role must be changed into another key-one less pleasant, more difficult and unsatisfying From now on to the end of the third act he must portray the picture of gradually flagging desire and failing powers, of disillusionment, fading pleasures and progressive fatigue, in other words, senescence, until his rôle ends in ultimate death of this tragicomedy is "The Life of Man," its three acts are entitled I, Evolution, II, Maturity, III, Involution It is the story of a living, multicellular organism—a chemicophysical machine transforming, storing and releasing energy -capable of building and restoring its own substance, and repairing its wear-and-tear damage within certain bounds, but only for a limited period of time. As is the case with all energyproducing machines, the life of the individual human machine is not immortal, but has, pertorce, from the very nature of its substance and construction, the complexity and intricate relationships of its manifold parts, and the peculiar nature of the work it has to do, a limited period of useful existence The individual machine wears out, but before wearing out it has the power of producing out of its own substance and energy-store the materials for the creation of other machines of its own kind Although mortal as an individual organism, it secures a potential immortality for its kind. It does this, however, at the price of its own self-destruction, for under normal conditions its duration of existence is determined by factors inherent within the machine itself

THE NATURE OF THE HUMAN MACHINE

We look upon the animal organism as a combustion apparatus which burns and transmutes mert materials into living protoplasm with the production of heat and vital energy. The manifestations of its work constitute the vital func-

tions of nutrition and metabolism, motility, irri-The essential goal of tability and reproduction its labor is the perpetuation and evolution of the species—the preservation, transmission and modification of the germ plasm. When this is assured or accomplished, the individual machine has served its purpose. Its duration of existence is determined, therefore, by the conditions and factors necessary to accomplish racial preservation and progress Important among these factors are the length of the period preceding puberty, the duration of the reproductive period, and the length of time required for the postnatal care of the progeny All of these factors are inherent within the germ plasm of the race, the individual's duration of life dependent upon such intrinsic factors is the normal or biologic span of life, and its termination constitutes normal or biologic death But this is not the only form of death that may come to the multicellular animal organism, nor is it the usual one Unfavorable factors in the environment may check the career of the individual at any time in its course—pathologic extrinsic death—the most common fate of animal life, or there may be present inherent abnormalities in the germ plasm of any given line fore-ordaining its early or premature termination —pathologic intrinsic death (inherited) few, if any, human beings achieve a biologic span of life and a normal intrinsic death, the great majority succumb to a pathological extrinsic death, a smaller number to a pathologic intrinsic death

Period of Evolution of the Human Machine

The life of the human individual created by the union of sperm and ovum consists of the relatively short intrauterine period of ten lunar months, and the much longer extrauterine period that may be extended over nine to ten decades, usually only seven or less Both of these periods —the intrauterine as well as the extrauterine represent a continuous progression from the beginning of the life of the individual to its end This may be represented by a curve, the ascending portion of which is the period of growth (evolution), its apex a relatively short plateau of maturity, and the descending curve the period of retrogression (involution) The ascending curve of growth begins in intrauterine life from the moment of the first division of the fertilized ovum, and shows two distinct periods, the embryonic and the fetal The energy of growth of the fertilized egg is greater than that at any other period in the life of the given individual During the second month the growth of the embryo

the spray rooms shut, and spraying in the open

This study, therefore, shows a high percentage of blood abnormalities, indicating benzol effects, a percentage considerably higher than in other studies on benzol It would seem from the above considerations more conservative and be of greater comparative value in the light of the findings of the Benzol Committee and the Spray Committee to use a leucocyte count under 5600 as the standard for abnormality As pointed out above this would give evidence of benzol effects of 321% and 208% against 259% in this study. We are dealing with groups exposed to hazards so far not widely That considerable hazard exists investigated is evident, that protection from continued benzol effects which may later precipitate serious symptoms, is indicated Such protection should be industrial, through installation of proper - ventilation, should be preventable, by continued medical observation of the workers, and prophylactic, by medical examination on entrance to this trade, so that normal physical and blood conditions may be known and periodically investigated

The following medical recommendations are made

- 1 A thorough physical examination on entrance to the trade
- 2 A complete blood examination to determine individual norms
- 3 Complete periodic examinations every three months
- 4 No worker should do spraying with paints or lacquers containing lead or benzol if he have symptoms and physical findings distinctly referable to lead or benzol, or if he have suspicious symptoms with a 25% reduction of red blood cells or a white count under 5600, with further blood examinations showing progressive reduction. When the original blood condition of each worker will be established, declining counts will immediately arouse suspicions of toxic influences.
- 5 Tuberculosis, suspected tuberculosis, chronic bronchitis, asthma, myocardial and valvular disease, nephritis or any blood dyscrasia, should exclude

and 50th years These boundaries are far from being fixed, the individual variations are great, and it is no more possible to say in what year the peak is reached than to determine the exact boundary between evolution and maturity or between maturity and regression. There is too much complicated interlocking of the vital processes, and the body machine is made of other smaller machines that vary in their periods of evolution and maturity We may say that the peak is that point at which the vital energies make use of the food taken in to run and repair the machine without adding to its substance. Nevertheless, after the attainment of reproductive maturity some growth takes place exceeding the repair of loss of substance. According to some authorities the limit of height may not be reached until the 35-40th year, and there is usually an increase in weight for both sexes during this period, largely due to an increase in the storage of fat and resulting from the disproportion between the fuelintake and fuel-consumption. To what extent this increase in adipose tissue is physiological or due to the environment of modern civilization cannot be positively determined Progressive ossification is also going on throughout this period, its significance may be that of regression rather than of growth Practically, therefore, maturity has been reached when an equilibrium between intake and replacement of old tissues

without the formation of additional ones occurs The period of maturity is the period of reproductive activity Both sexes have completed their sexual developments and are now ready to carry out their greatest function, the propagation of their race, and the vital energies of this period urge them relentlessly to this consummation the male to the activities of impregnating, protection of the female and his progeny, the female to her more strenuous sexual functions of ovulation and menstruation, pregnancy, birth, lactation, and the maternal care of the offspring The age of sexual activity is also the creative and productive age, particularly for the male The success of his life, his career in business or profession, his fullest mental and spiritual development, his happiness are more closely related to and dependent upon his management of his reproductive period than upon any other period of his life If measured by fertility the high point of life falls somewhere between the 25th and the 37th years The simple production of progeny, however, cannot be taken as the index to the highest point of life efficiency and achievement, because of the long postnatal period of care necessary for the preservation and evolution of human progeny It is, therefore, more reasonable to assume that normally the peak of life extends into the fifth decade (See Figure 1)

FIGURE 1 The Stages of Life (Altered and adapted after Stratz)

is relatively greater than that from the period of and proceritas birth to maturity, in the third month its growth equals relatively that of the first six years of extrauterine life, in the fourth month as much as in the first three years, and in the fifth month as' much as in the first year after birth This extraordinary energy of growth following fertilization consists chiefly in the production of cellmasses and their differentiation into the three By the end of the first month the germ-layers embryo has passed through the most essential stages of its pre-human development, by the end of the second month it has attained well-defined human form, and in the third month its sex can be clearly recognized This closes the germinal or embryonic period, and fetal growth and differentiation now proceed with a remarkable loss of growth energy Not all organs and tissues grow at the same rate, and these differences determine bodily form and proportions

After approximately 280 days the period of intrauterine life is completed, and with birth the individual enters upon his extrauterine period of growth and development which leads essentially to increase in height and weight. During this time also the differences in rate of growth bring about further changes in the bodily proportions. Within this period there occur also the development of the teeth, the conformation of the head and face, the ossification of the bones, and various changes in the viscera and soft tissues. The period of extrauterine evolution extends from birth to that of maturity or completed sexual

ripeness This period shows also six well-defined subdivisions in which growth proceeds at varying rates and for different purposes of evolution. The period of the nursling's development, followed by the period of neutral infancy with its two cycles of stationary and accelerated growth, the first periods of turgor and proceritas, then the bisexual period of childhood with also two distinct phases of growth, the second periods of turgor and proceritas, and finally the period of adolescence After birth the growth-energy is strongest during the first year, height is increased about 50 per cent and weight about 200 per cent preponderance of weight increase over height increase gives to the first year of life the greatest fullness and rotundity of body seen at any stage of life

Boys attain half of their total height by the end of the third year, while girls attain the same at the end of the second year Half of the total weight for boys is attained in the 13th year, by girls in the 11th year. It is important to note that the extrauterine expenditure of growth energy does not progress uniformly, but in wave-like movements of retardation and acceleration. This may be roughly indicated as the 2-4, 5-7, 8-10, 11-15 year periods, constituting the first and second cycles of turgor

From the 16-20th years the curves of growth for the boy become steeper, those for the girl gradually flatter Both sexes become larger, fuller and more powerful Complete maturity of growth, as evidenced by the flattening of the height-weight curves is usually attained by the male at 28 years of age, and by the female at 24 years, at these ages the plateau of maturity or ripeness is reached, and the vital energies of the organism are directed toward the business of reproduction All of the energy-producing and expenditure from the fertilization of the ovum, through embryonic and fetal life, birth, and the six growth periods of extrauterine life have been apparently chiefly, or solely, for the attainment of this end, that the species shall not perish from the earth, but shall be renewed—with evolutionary modifications, we must surmise—or the whole process seems without reason

We have taken the height-weight curves as the most striking and important indices of the period of evolution Similar curves could be plotted for the growth of the individual organs and tissues In each of the eight periods of growth that we recognize as constituting the whole period of evolution there are constant changes in bodily proportions taking place due to the unequal growth of the different organs and As a general rule the organs that show the greatest degree of growth in extrauterine life are those that were the least developed at birth During the period of evolution the vital energy for growth is so strong that it exceeds that of the functional, at maturity the two are so balanced that cell destruction and cell growth are so equalized that repair is possible without loss of tissue elements In Figure 2 the curves of functional development are shown for the different decades of life Starting at birth the curve of nutrition and metabolism falls relatively as the body attains its development, and at the 20th year continues on a horizontal plane, the motility curve ascends proportionately to that of growth until the period of maturity, reaching its height during the third decade, the curve of reproduction remains neutral until the sharp rise at puberty and begins to fall at about 30, declining more rapidly than the functions of motility The curve of the cerebral and and nutrition spiritual function ascends sharply, closely paralleling the curve of growth, but continues to ascend after this period is ended, beginning to fall at about the middle of the seventh decade is the only vital function that shows persistent evolution after the termination of the period of growth

PERIOD OF MATURITY

With the attainment of sexual maturity the peak of life is reached somewhere in the level plateau of the curves of growth between the 30th

tissues Too-great variations are not common as physiologic phenomena and must be regarded as having a pathological significance

Functional Changes During Senescence

In Figure 2 the life curves of the four chief vital functions of sensibility, motility, reproduction and nutrition are given for a life of 100 years. These vital functions develop closely to-

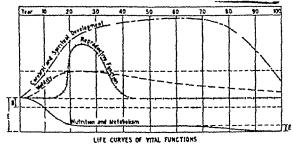

Fig 2 (Based in part upon Strats Author's modification)

gether and supplement one another, but show very different values at different periods of their evolution. The curve of nutrition rate drops from birth, being most active in the first and second decades, is maintained thence at a level until about sixty, when the curve descends progressively until the end. The central nervous system functional curve rises continuously from birth until about the seventieth year when it be-

gins a rapid descent. The curve of motility rises during the first two decades of life, reaches a plateau for a decade or more, and falls gradually from about the thirty-fifth year. The curve for the reproductive function is stationary from birth until about the middle of the second decade, rising steeply to reach its apex in the third, and falling to a neutral level in the fifth decade. Each decade of life has, therefore, its corresponding functional activity, and prepares for the vital processes of the succeeding ones.

In Figure 3 the comparative physiology of the stages of growth, maturity and involution are shown for the most important organs and tissues

Height Full height is usually not attained until about the 35th-40th year, although the increase after the 20th year is relatively small. After the 65th year there is a gradual decrease in height, more marked after the 75th year, in all about 1-5 cm.

Weight Very difficult is the determination of average normal weight curves. The individual variations are very great, and the influences of environment, personal habits, sexual activity, reduction in vital energy, etc., produce still greater variations. While many people attain their greatest weight at 25-30, others reach it only in the fourth decade. As the reproductive function declines the majority of both sexes show an increase in adipose tissue, and this increase may persist, or the weight be maintained at this level

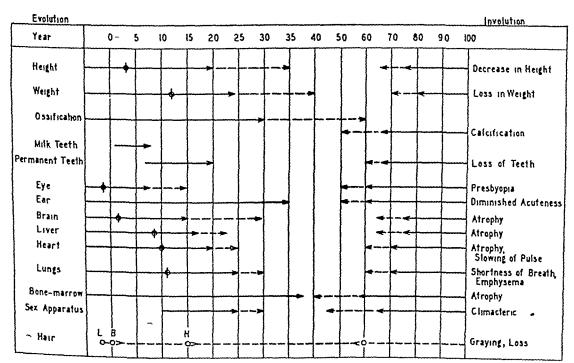

Figure 3 Physiology of Growth and Involution (Based in a small part upon Stratz Chiefly author's own material)

Period of Involution

When the object of the reproductive period has been achieved-when progeny has been secured and its independent existence secured, the mature carrier of germ plasm is no longer necessary in the scheme of evolution Having fulfilled his biological duty, he must pass from the scene, and his withdrawal is brought about gradually and slowly through the involution of his energy-machine and the weakening of his vital functions He must pass now through the regressive periods of senescence and old age until the final release is obtained through death. We are now confronted with the mystery and problem But is it any of protoplasmic involution stranger than that of protoplasmic evolution and progressive growth? Indeed, in the economy of the human energy-machine the two processes have been coexistent from the time of the fertilization of the ovum and the beginning of its cell-Throughout the whole period of development, both intra- and extrauterine, the regression or involution of temporary structures and organs has taken place, these served their purpose of usefulness for a certain time and disappeared during the ascent of the organism to We need only mention the gillits maturity slits, the placenta, umbilical cord, the ductus arteriosus, the umbilical vessels, the urachus, the milk teeth and the thymus among the various structures that undergo involution after the completion of their temporary functions Especially remarkable is the life-history of the placenta At the birth of the organism it is a senile structure repeating in detail much of the pathologic tissuechanges that later are to appear in the aging process of the mature organism. The sclerosis of arteries, fibrosis of stroma, atrophy and degeneration of the chorionic epithelium, necrosis of villi, thrombosis and calcification, all of this pathology of old age appears in this important vascular organ at the completion of intrauterine In the fulfillment of its function the placenta passes through well-defined stages of evolution, maturity and senescence and when its work is over it is discarded as useless and disappears from the scene of the individual life Prophetic of the future fate of the organism as

The human mind accepts these localized organand tissue-involutions as reasonable and normal processes in the evolution of the human body, they excite no apprehension, no fears, no regrets, to the average uneducated individual they are wholly unknown. Quite different is the case with respect to the signs and manifestations of that major involution involving the organism as a whole. We regard the appearance of senescent signs as a tragic joke played upon us, which we resent more or less with bitterness. We may attempt to blind ourselves to the fact that the

peak of life has been passed and that the downhill march has begun, and that from that first moment of recognition the descent is progressive and inevitable to the moment of final extinction But we cannot, and the severest test of human character is at hand, whether we shall accept the situation with equanimity or in sorrow vainly regretting

Just when the tide begins to turn in any given individual from the high-water mark of maturity down hill cannot be determined with accu-The individual variations are great, five to twenty years in apparently normal individuals It becomes very difficult, therefore, to differentiate a normal first climacteric from a premature or a deferred one The transition from the stage of growth-equilibrium to that of regression shows no sharp line of demarcation Age comes at first with a slow and insidious approach, unheralded and unperceived, until all at once the unwelcome guest is established with us functions of the various organs and tissues do not begin to diminish uniformly, there is an interlocking of mature function and retrogression, just as there is in the case of incompletely evolved and mature function on the ascending curve of life Senescence is, therefore, a gradually developing complex or syndrome of organ and tissue involutions When these become sufficiently advanced as to become clinically apparent, then we say "Age is upon us" The aging process consists, therefore, of a combination of organ- and tissue-involutions, shown histologically by well-defined tissue-lesions and manifested clinically by descending function-curves While these individual tissue and organ involutions begin at different times, and are to some extent independent of each other, each single line of involution once well initiated, may through the weakening or loss of the given function, initiate or strengthen retrogressive changes in other The various lines of involution are not wholly independent, but in the general economy aid and supplement one another until various vicious circles and correlations of retrogression are produced Senescence is the gradual development of these lines of retrogression—the resulting complex is Old Age Beginning very gradually and insidiously in the fifth and sixth decades of life for the two sexes respectively, the Age-Complex rises rapidly above the clinical horizon in the seventh decade, and in the average individual is usually well-developed in the period from 65 to 70 years By this time the energy-charge of the organism has fallen so low that senility is usually established in all organs and tissues and manifests itself in a change in There are, of course, great indiall functions vidual variations in this descent of the energy curve, not only as regards the involution of the organism as a whole but as regards individual

Urmary Function Disturbances of this function are very common after the 60th year Polyuria, nysturia, pollakiuria, retention, incontinence, cystic glandular hyperplasia of the prostate leading to stasis, cystitis, calculus, etc, are among the most unpleasant and almost universal symptoms of the senile period. We are even at a greater handicap here in differentiating normal involutions and pathological processes, and the individual equation plays a very large role as to the extent and degree of the urinary disturbances of old age

Graying of the hair is regarded as a physiologic involutionary change and usually has appeared by the 60th year Coincident with this is the appearance of the coarse "senile bristles" in the nose, ears and eyebrows The body hair becomes more abundant and also coarser It is still a mooted question whether baldness is a physiologic involution, or an inherited pathologic condition, or a pathologic condition resulting from the habits and conditions of life Some individuals achieve the extreme limits of age without becoming bald, the majority, however, show varying degrees of baldness after maturity has been passed, the daily loss of hair exceeding the new growth Changes in the elasticity of the skin usually accompany those of the "Wrinkles," roughness, body and head hair discoloration and a tendency to hyperkeratosis gradually develop after the 55th year but here again the individual variations are so great and the influence of the environment so potent that no positive statement can be made as to the time and degree of the skin changes due The same thing may be said as to the sinking of the female breast as an index of age, it occurs in some women even shortly after puberty All soft parts of the body undergo a very appreciable shrinking after the age of 70 due to the loss of water content

Reproductive Function Inasmuch as this is the chief function of the individual life and from the biological point of view the one logical reason for the ascent and maturity of the animal energy machine, it is but logical to conclude that when the carrier of the immortal germ plasm has arrived at maturity and continued at that stage sufficiently long enough to have secured its survival in his progeny, he, himself, is now in the way of Biologically useless he now becomes, and he disappears by a gradual fadingaway process from the active stage of life The old saying, expressed less vulgarly than in the original form, that "When the reproductive capacity has ceased, then the man is as good as dead!", is based upon an absolute foundation-fact. All of the evolutionary process of life prepares the animal organism for the performance of this function, and as soon

as it has been accomplished the tide of involution begins to turn. If we judge the course of this function by its results in progeny-that is, by the fertility of the human race—we see that its peak is reached in the third decade of life There are so many other factors determining the production of children during this period, that fertility and reproductive capacity do not necessarily produce parallel curves, and it is much more probable that the peak of the curve of the functional capacity for reproduction falls rather in the latter part of the 4th decade or about the beginning of the 5th There takes place then a very rapid decline in reproductive capacity for both seves, earlier and more rapidly in the female, so that by 45-50 she usually loses the function of reproductive power climacteric for the male is usually placed about ten years later, at 55-60 We do not know, however, the approximate time when spermatogenesis in the human male ceases been generally assumed that active spermatogenesis in man persists usually until about the 63rd year, and in some men until a much later time There are, of course, in the literature numerous tales of very old men becoming fathers. It is possible that the individual variations as to spermatogenic function are as great as these stories would indicate, but it is also doubtful that many of those tales of senile fatherhood are true Few male bodies over 55 years of age come to the autopsy table with evidence of active or normal spermatogenesis in their testes. While it is possible that in many of these cases of aspermatogenesis this condition is the result of the disease causing the death of the individual, the same condition is also found in the testes of healthy individuals at the same age dying of accident The writer is inclined to believe that for the majority of men active sperm-formation ceases in the 6th decade The absence of sperm in the semen has apparently no relationship to the persistence of sexual desire and potency for sexual intercourse, as these features of the reproductive function may persist, and even increase in intensity long after all spermcells have disappeared from the semen. After spermatogenesis has ceased it would appear that the continuation of virility constitutes a certain social function in holding parents together until the children's future is assured Experience has taught the writer that many men over 50 years of age, priding themselves on the preservation of their virility, but unable to achieve children in marriage with younger nomen, show on microscopic examination total absence of spermatozoa in the seminal discharges and without a history of previous veneral disease. This is not a question that has received any adequate investigative study,

until the latter part of the seventh decade. How much of the climacteric tendency to obesity is physiologic, how much of it pathologic, due to disproportion between intake and combustion, remains to be determined. In a certain degree the obesity of this period must be regarded as one of the signs of senescence, associated with the decline of the reproductive function (spermatogenesis) and general activity. After the 70th year there is a very definite loss of 2-5 kg, due to the loss of the water-content and other changes in the connective tissues.

Skeleton Processes of ossification may go on in the body even up to the 60th year, but the normal extent is usually reached by the 30th Through the loss of water-content the old bones become firmer, and this process continues progressively during the period of involution After 50 years the long bones and the larger flat ones gradually become osteoporotic, with larger marrow spaces and corresponding increased fragility They may retain, however, their normal The spinal column becomes conformation shorter and more sharply curved, the intervertebral disks become contracted and thinner loss of the teeth atrophy of the alveolar processes occurs, and there is developed the characteristic senile facies which cannot wholly be concealed by artificial teeth In the skull the sutures become indistinct or may wholly disappear

Calcification Coincident with the beginnings of osteoporosis deposits of lime-salts begin to appear in sclerotic blood vessels, cartilages and elsewhere. This is always to be regared as a retrogressive condition, secondary to some previous degenerative change. The demarcation between the purely physiologic involution change and pathological processes of calcification is very difficult of determination, and we possess no criterion but that of degree

Teeth The teeth are usually fully developed by the 25th year, in exceptional cases by the 30th, and under physiologic conditions should persist until about the 65th year. Under modern conditions scarcely an individual of 50 years is in full possession of sound teeth, and the majority may be lost by 60 years.

From the time of birth the field of Evesight accommodation is progressively narrowed, from 14 diopters in the nursling, to 12 diopters at 15 years, 10 diopters at 20 years, 7 at 30 years, 4 at 40 years, 2 at 50 years, and under 1 at 60 These changes constitute perhaps the best index of physiologic age recognizable clin-This narrowing of the visual function leads gradually to presbyopia between 45-50, increasing much after 50 years In many individuals the advent of far-sightedness is the first recognizable sign of senescence and the recourse to eye-glasses marks the period There is a very close relationship between its appearance and the

beginning of the decline of the reproductive function

Hearing A decided loss in acuteness of hearing begins usually at about 65 years, and may increase progressively to the end of life. In the very old the degree of deafness is usually marked

Intellectual and Spiritual Life While there are great individual variations, these functions of the central nervous system usually are preserved in physiologic old age and may increase in value until about the 65th year when some impairment of memory and mental reaction may begin to show, after 70 the retrogression of cerebral function proceeds rapidly, so that in those who reach or pass the 80th year a characteristic picture of "second childhood" develops Here again we are confronted with the very great difficulty of distinguishing between physiologic involution and pathologic conditions because of the great range of individual variation

Digestive Function A lowering of this function begins shortly after the 60th year, and is shown chiefly in a lessened appetite, "heavy" and unpleasant digestion, gas-production and constipation. These evidences of lowered function in the alimentary tract increase progressively to the end of life. An inadequacy of pancreatic function is frequently shown in the so-called "benign glycosuria" of the aged. The bilirubin content of the blood serum is usually increased in old age.

Circulation The pulse rate falls from 120 at birth to 70-80 at maturity, and after the 60th year to 60 per minute. In the majority of individuals there is usually an increase in tension from the 50th year on to about the 70th when many old people show a decided lowering. More or less marked irregularity is common after the 65th year. Particularly with respect to this function are the boundaries between physiologic involution and pathologic conditions very poorly defined, and the individual variations are very large.

Respiration The respiratory rate sinks from 28 in the newborn to 18 per minute at maturity and to 16 or lower in the old man Expiration is prolonged Shortness of breath, in severe degrees asthmatic in character, constitutes one of the unpleasant symptoms of old age.

Bone-marrow and Lymphoid Tissues Blood-cell formation is reduced, the senile individual presents a certain degree of secondary anemia Although immune to a large number of the infectious diseases through which he has passed in the course of his life the senile individual loses resistance to the respiratory infections, the pyogenic cocci and to mould infections of the skin and to thrush Various forms of tinea pruntus are very common in the aged, and erysipelas increases in incidence during this period

leading questions arise When will such a biologic death take place and how is it brought about? What is the natural limit of human life? By many biologists it is theoretically placed at about 100 years, but many old people reach natural death 10-20 years earlier, and a small number exceed this limit by a number The individual variations are so great, and the differentiation of a natural intrinsic death from a pathologic extrinsic one so difficult that we possess no large amount of pathologic knowledge in regard to this point Nevertheless, deaths do occur in the aged that we must ascribe to the primary lesions of senility alone, as all evidence of extrinsic disease is absent. It is a well-known fact that sudden death in old people is not uncommon during the enforced rest following a cataract opera-When allowed to get up, the atrophic heart which has lost tone through the period of mactivity cannot recover its oxygenation power, an acute inadequacy of the myocardium results with dilatation and sudden death only lesions of any significance found in some of these cases are those of old age less coronary sclerosis, atrophy and fatty degenerative infiltration of the heart muscle. The same conditions precisely will be found in the hearts of old people who have died quietly in bed It is fair, I think, to ascribe these deaths to senility, although such a term is not an accepted designation as a cause of death my experience of 38 years I have seen not more than 25 autopsies in which I felt that the pathologic diagnosis of pure intrinsic senile death could be justified, and all of these were due to myocardial atrophy and inadequacy

Personally, I would regard this tissue-condition as the most probable natural terminal lesson of life The purely senile death should be, herefore, a cardiac death The vital function of the circulation is more likely to cease before that of respiration or of the nervous system The cause of intrinsic biologic death is inherited in the cell, few individuals will attain it because of the varying environment and the individual varying intrinsic reactions to the environment. The average equation resulting between these two factors brings about a life limit shorter by 15-25 years than the theoretic biologic limit of 100 years fact has tended to fix in the popular mind the Psalmists three score and ten as the ideal term of human life But only a small per cent of human beings born alive can hope to attain even this Out of every one hundred human beings born alive only about 4-8 per cent pass the 60th year Twenty per cent die in the first year of life, by the age of 20 years 40 per cent have died, and only 2-4 per cent attain the age of 80 (See Figure 4) The lowered resistance of the body during the period of

senescence, and the pathologic conditions secondary to and dependent upon the tissue-lesions of involution are the causes responsible for the rapid increase of deaths after the peak

Fig 4—Expectancy of the duration of life in different decades in 1800 and 1900, according to Hufeland and Silbergleit

of maturity has passed Modern sanitary and hygienic science has, however, increased markedly the number of senescent survivors According to Hufeland, in 1800, only 9 individuals out of 100 reached the age of 50, according to Silbergleit, in 1900, there were 40 out of every hundred who attained this age (figures for the population of North Germany This represents a conquest of modern life over the environment, and means a greater expectancy of life at birth, and an average longer duration of life The intrinsic inherited biologic duration of life, however, remains the same, and cannot be affected by these changed conditions, except possibly in a long evolutionary period The senile survivors for the half decades from 80 to 100 years are given for the last five United States Census Reports and the relative proportion to the total population is given for the ages 80-89 and 90-100 for the same periods. While the 1920 census shows an increase of senile survivors in the 80-89 decade over that of 1880, there is practically no increase in the ratio of survivors in the 90-100 decade during the same period of time. This is in harmony with our view Improved modern life increases the number of senescent survivors up to the 80-89 decade, but does not increase the number of senile survivors after the age of 90 Modern conditions, as expected, have not extended the individual biologic life limit, and cannot do so

PRIMARY INVOLUTION TISSUE CHANGES

The tissue changes of the involutionary process are identically the same for the period of senescence as for the involution processes of temporary structures during intrauterine life and in the extrauterine period of evolution

such is badly needed to throw additional light on the senescent period From what knowledge we possess we can say reasonably that the peak of life coincides with the peak of the reproductive capacity (spermatogenesis), and downhill retrogression of senescence runs a fairly close parallel with the decline of the spermatic function It should be emphasized in this connection that this view of senescence has nothing in common with the interstitial-cell theory Coincident with the retrogression of the sperm-cell production go other evidences of a progressive loss of energy Chronic and progressive fatigue, lack of agressiveness, disillusionment, mental and spiritual depression and a gradual lowering of all activities mark this decline in varying degrees If we sum up all of the functional evidences of involution, and group them as to their order of appearance and importance it is interesting to note that the first signs of age noted by the average male at this period are Presbyopia, sexual neurasthenia, and chronic fa-This triad of symptoms may be taken as marking the advent of senescence

THE PICTURE OF FULLY DEVELOPED SENILITY

By the 65th-70th year the processes of involution have usually become so evident that the fully developed picture of Old Age is pre-The main features of this picture may be summed up briefly, as follows A stooping or bent posture, reduction in height, increased bony prominences, stiffness of joints, loss of stretching power, a shuffling gait, uncertain movements, appearance of general weakness, loss of coordination, tremors, general emaciation, flabby panniculus, dependent breasts, hang-belly, flabby and soft musculature, hernias, prolapse, flabby and shrunken genitalia, frequent hydrocele, loss of teeth and atrophy of alveolar processes, barrel-shaper thorax with widening of the epigastric angle, obliterated interspaces, the skin inelastic, wrinkled, rough, showing patchy pigmentations and hyperkeratoses, there is graying and loss of the head hair, while senile bristles occur in the evebrows, nostrils and ears, the body hair is usually increased, coarser, and gray or white, vision is dim and uncertain, the conjunctiva are reddened and watery, the cornea dull, the limbus opaque, hearing is dulled, the voice husky or cracked, speech slowed and uncertain, the mouth is dry, the tongue coated and fissured, and there is a slight husky cough, respiration is slowed, and shallow, with prolonged expiration, the peripheral arteries are tortuous and hard, the pulse slow, irregular and frequently increased tension, there is a tendency to varicose veins and hemorrhoids, the metabolic rate is lowered, the secretions of all organs diminished, digestion is slow and

difficult, excessive gas production, eructations and constipation occur in varying degrees, benign glycosuria is not uncommon, bladder control is lost to some extent, retention, polla kiuria, nycturia, and incontinence are frequent symptoms, the bodily temperature is frequently subnormal, and the senile individual complains of cold and is easily chilled, the sensory nerve-endings, tactile, sexual, etc., are dulled, and finally the involution processes, in the central nervous system show themselves in loss of memory, slowness of mental reactions, aphasias, psychical fatigue, and weakness, irritability, changes in personal habits, daytime sleeping and nocturnal insomnia, "second childhood" and dementia The picture of fully developed senility is well illustrated in A picture of the contrast between an old father of 80 years and his son of 37 years emphasizes the differences existing between the period of full maturity and that of advanced senility weary, worn-out machine of the old man contrasted with the insolent aggressiveness of the son in the height of his maturity tells the story of the meaning of involution and old age more effectively than any detailed scientific description can do Only in Solomon's figurative description of old age in the last chapter of Ecclesiastes is there to be found in any of the world's literature an adequate word-picture of the closing days of human life "In the day when the keepers of the house shall tremble, and the strong men shall bow themselves, and the grinders cease because they are few, and those that look out of the windows be darkened.

"And the doors shall be shut in the streets, when the sound of the grinding is low, and he shall rise up at the voice of the bird, and all of the daughters of music shall be brought low,

"Also when they shall be afraid of that which is high, and fears shall be in the way, and the almond tree shall flourish, and the grasshopper shall be a burden, and desire shall fail because man goeth to his long home, and the mourners go about the streets"

TERMINATION OF THE INVOLUTION PROCESS IN INTRINSIC DEATH

When the involution of the organism has reached such a degree of functional lowering that any one of the vital functions cannot carry on, then biologic death takes place, and the career of the individual human organism is closed. As we said early in this paper such a biologic or normal death is rarely achieved by man—he usually succumbs to influences of the environment or dies prematurely because of inherent pathological defects in his organism. Assuming, however, a case in which an individual achieves a natural biologic death two

brownish in color and filled with lipoid drop-In many cases they form such striking masses of cells scattered among the atrophic tubules that an increased number seems possible This prominence of these cells may persist, and apparently does so, until the end of life Such changes are wholly in contradiction to any theory of a rejuvenating internal secretion ascribed to these cells On the other hand these cell changes support the view that their function is a metabolic, nutritional one, concerned in the process of spermatogenesis, and when this process comes to an end, these cells become over-burdened with a lipoid pigment similar to the disuse lipoid pigmentations occurring in other atrophic tissues

SECONDARY PATHOLOGY OF SENILITY

The secondary pathologic conditions that are made possible and favored by the primary involution process are many and of great clinical importance, because it is usually through some one of these that the senile individual is kept from achieving a biologic death. They include nearly all of the causes of deaths occurring at the period of life. They fall into several well-defined groups —

- 1 Secondary to the Vascular Changes Thrombosis, embolism, infarction, atrophy, apoplexy, cerebral softening, paralysis, psychical degeneration, etc, due to cerebral arteriosclerosis, coronary sclerosis, thrombosis, myocardial infarction, angina pectoris, cardias insufficiency, etc, renal arteriosclerosis, contracted kidney, nephrosis, chronic nephritis, etc, peripheral sclerosis leading to gangrene. Sclerosis of aorta, aortalgia, angina
- 2 Secondary to the General Atrophy Reduced functions of all organs including endocrinal General lowering of resistance Increased susceptibility to respiratory infections, bronchitis, broncho-pneumonia, erysipelas, etc Functional inadequacies, glycosuria, etc
- 3 Stass Condition Infections of urmary and genital tract, cystitis, prostatitis, pyelitis, infections of biliary and pancreatic tracts, stasis catarrhs of alimentary tract, constipation, etc Formation of calculi in any of the body passages (biliary, urmary, salivary, etc)

The most important of these pathologic conditions of old age secondary to the primary lesions of old age are shown in Figure 5

Concentration of Disease in Certain Age Periods

Another striking relationship between disease and the time of life is shown on Figure 6, which represents the predominance of certain diseases in different age-periods, rachitis in the first five years, rheumatic fever in child-

Central Nervous System—
Cerebral arteriosclerosis.
Thrombosis Embolism. Infarction Hemorrhage.
Atrophy Sclerosis

Loss of memory Loss of self-control Perversion.

ciated with the aging process

hood, tuberculosis in the late childhood and adolescent period, venereal diseases at puberty and early adult life with the carrying on of syphilis through middle life producing many varied pathologic conditions then, neoplasms other than carcinoma in the early part of adult life, carcinoma in the senescent period, likewise in this period various metabolic conditions associated with the progressive loss of energy, cardiovascular diseases in senility, and two periods for diseases of the nervous system, that

The changes in the senescent placenta may be taken as an example of their nature a progressive thickening and contraction of the chorionic stroma, from a loose semimyxomatous tissue it becomes increasingly fibroid, its stroma cells fewer in number, and the intercellular substance more hyaline in character, the blood-vessels show thickened and more hyaline walls, and the lumina gradually become nar-The cell-layer of Langhans of the chorionic ectoderm disappears by the middle or end of the third month of pregnancy, the syncytium undergoes a gradual loss in proliferative power syncytial buds become fewer, and on the older and more fibroid portions of the chorion localized necrosis of the syncytium takes place, preceded by marked nuclear pyknosis and vacuolation Intervillous thrombi are formed on the dead and degenerating syncytium, deposits of lime salts take place when the vascular sclerosis and obliteration reaches a certain stage A slow anemic infarction of a cotyledon or portion of such may take placethe physiologic anemic infarct of the placenta Without going further into detail of the changes in the various organ and tissue involutions, we may say that essentially they present identical tissue lesions, and that these are the same in the involutionary processes of old age These involutionary tissuechanges are ---

1 Loss of power of division Fewer mitoses Fewer regenerative proliferations Nu-

merical atrophy

2 Quantitative atrophy Parenchymatous cells fewer in number and smaller in size Reduction in cytoplasm and in nucleus Condensation of chromatin, pyknosis, eventually vacuolation and karyolysis Frequent appearances of lipoid droplets in cell cytoplasm, in many cells lipoid pigments appear

3 Shrinking and condensation of intercellular substance, most frequently a hyaline fibrosis, loss of water, changes in colloid state, in the panniculi the fat cells are replaced by a mucin-containing stroma resembling that

seen in myedema

These are charac-Vascular changes teristic of the involutionary process at all periods, and must be inherent within the vessels themselves, masmuch as wear-and-tear forces can hardly explain the sclerotic changes occurring in the ductus arteriosus, umbilical vessels, involuting thymus, and later in the ovary after the first follicle has ripened and discharged In all periods of involution the vascular changes are histologically identical with those occurring during senescence Without going into a detailed description of the wellknown features of the arteriosclerosis of age, the essential features of which are an atherofibrosis of the vessel wall, with or without

proliferative changes, ultimate loss of elastic tissue and muscle cells, occlusive or with dilatation of lumen, and incidental limesalt deposits Aside from the processes of thrombosis, embolism, aneurismal dilatation, rupture, etc, which may be secondary to the vascular changes, the resulting disturbances of circulation in the parts supplied by such sclerotic vessels are extremely important in the secondary pathology of senescence 1 The main features of the gross pathology of the viscera of the senescent body are 1, Atrophy Reduction in size except in the case of the emphysematous lung and the hyperplastic prostate, 2, Increase in consistency, due to the relative increase in stroma, 3 Changes in color, browner or grayer, 4, Increased translucency, 5, Serous atrophy of adipose tissue Throughout the entire body, there is an increased toughness of the connective tissue membranes Special senile features of the and fascias autopsy are the increased adherence of the dura mater, the erosion of the inner table of the skull, the Pacchionian erosions and perforations, the thickened and more opaque meninges, the more sharply pointed cerebral convolutions, the thickened and frequently cystic chorioid plexus, the discoloration and calcification of the cartilages, osteoporosis of bones, pulmonary emphysema, low diaphragm, barrel thorax, droplet heart, ptoses of gastrointestinal organs, the generalized atrophy and passive congestion The atrophy of the viscera shows most markedly in the spleen, liver, testes, heart, lungs and pancreas, differing in this order from the atrophy of starvation adrenals always show an excessive degree of lipidosis The atrophic testes are browner in color from the lipoid pigment increase in the interstitial cells

Before leaving the subject of the primary pathology of age, the changes in the testis deserve additional attention So much has been said about the potential immortality of the germ plasma that many people assume that its existence in the sex-glands, at least in the testis, continues until the end of the life of the individual We have made it clear above that the germinal epithelium of the spermatic tubules undergoes retrogression very early in senescence, and that its atrophy is practically coincident with the advent of senescence the very old individual the testis may be fibroid, or nearly so, the tubules being represented by the hyaline basement membranes of the old tubules If any tubules still persist the epithelium is reduced to a single layer of low vacuolated cells, or the epithelium may be entirely gone As this atrophy of the spermatogenic tissues develops in the early part of senescence the so-called interstitial cells (puberty gland) become larger and more prominent,

they look upon the phenomena of involution shown in senescence as in any way different from that of the involution of the temporary organs and tissues shown in early embryonic, throughout the period of fetal life, the early periods of extrauterine development, and in fact throughout the whole period of existence of There is no difference in kind the organism in any of these localized involutions, they take place to get rid of parts that have fulfilled their use, the very same factors come into play when the organism has completed its function and must be removed from the scene -it is only a question of time and degree of Senescence cannot be considered involution as a physiologic entity belonging to the latter period of the metazoan organism. Involution and Evolution are inseparable processes and go hand in hand from the time of the union of sperm cell and ovum The discarding of the polar bodies, the loss of the tail of the sperm cell, the very act of fertilization, are prophetic of future involutionary processes in the life of The senescent process is pothe organism tent, therefore, from the very beginning, and grows in volume and extent in proportion to just one thing—the fulfillment of function None of the theories of senescence detailed above is applicable to these earlier and localized senescences, if they cannot be fitted to the explanation of these, they cannot be applied to the explanation of the major senescence It is evident then that involution is a biologic entity equally important with evolution in the broad scheme of the immortal procession of life Its processes are as physiologic as those of growth It is, therefore, inherent in the cell itself, an intrinsic, inherent, inherited quality of the germ plasm, and no slur or stigma of pathologic should be cast upon this process What its exact chemico-physical mechanism is will be known only when we know the nature of the energy-charge and the energy-release of the cell We may say that senescence is due primarily to the gradually weakening energy-charge set in action by the moment of fertilization The immortality of the germ plasm is dependent upon the renewal of this energy-charge from generation to generation

Conclusion

What philosophy then may we draw from this! Is old age inevitable? Yes, escape from it is possible only for those who meet a premature pathologic death. For those who live to their biologic limit age cannot be escaped. Nor can it be deferred. Nor is rejuvenescence possible. The deferring of old age, the rejuvenating of the senescent individual is but idle.

and foolish talk, and we have had much of this in the last decade. What modern medicine has accomplished along the lines of hygiene and the prevention of disease has been only to increase the number of human individuals, both the fit and the unfit—unfortunately too many of the latter kind—who come to maturity and to the period of senescence More individuals will achieve their biologic life limit, and this means what-ultimately a much greater increase in the number of senile, more or less useless, human beings in the age decades of the eighties and the nineties. There will be some increase in the number who will reach the age of one hundred years or even pass it, due to their own family inheritance, but this number will not be greatly increased in the present period of evolution. But what advantage is gained by increasing the number of human dependents in the period of second childhood! Does this thought never occur to the enthusiastic propagandists for the extension of life! I have never seen it mentioned in the literature of such propaganda may be individuals who wish to live to the very limit of their biologic allotment, to pass the last decade or two of their descent to the grave in uselessness, non-productive existence, dependency, in personal discomfort, and a burden to others-I personally am not of that sort Rather the limit set by the Psalmist-"The days of our years are three-score years and ten, and if by reason of strength they be fourscore years, yet is their strength, labor and sorrow, for it is soon cut off, and we fly away" (Psalm 90, tenth verse) The compensations of the seventh and eighth decades are many because of the longer preservation of the spiritual and mental function over that of the other functions. In a life well-ordered and well-spent, of varied physical and mental activities, the break in cerebral function comes in the average case somewhat around the 70th year, and the rapid down-hill descent is usually not apparent until after the seventy-fifth this, of course, there are wide individual variations But with mental powers still preserved this period from sixty-five to seventy-five may be one of satisfaction, even of productiveness There is an old folk-word, "The first joys of life are those of the belly, the last ones those of the mind, but the fool knows none but those of the belly" Happy then is the senescent who can approach his inevitable end with normal cerebral rate of involution, still capable of intellectual pleasures, and the mature contemplation thereof, and meet a speedy release before the unhappy days of second childhood are upon him

of early sexual life and that of early senescence Numerous factors concerned with environment, stage of development, social, emotional, etc, are concerned in this concentration of dis-

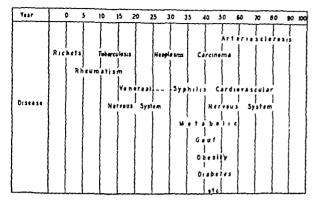

FIG 6—Concentration of pathologic conditions in various age-periods

eases in certain periods of life, and cannot be discussed here. The association of carcinoma with the senescent period is so striking that cancer is regarded by many as a disease of senescence. It, however, does not occur in all old people, as does arteriosclerosis, it is not a primary involution process, and not a biologic retrogression, it, therefore, is not an essential feature of old age, but is dependent upon an inherited pathologic anomaly of constitution, that like gout and other metabolic anomalies asserts its development coincidentally with senescence.

THEORIES OF SENESCENCE

Curiously enough many medical men of the last century, lacking the wisdom of David and Solomon in recognizing that the life of man has a definite normal limit, have regarded the aging process as a progressive disease, according to Brown-Sequard caused by the sclerotic changes in the vessels, according to Metschnikoff by intestinal putrefaction, according to Victor Horsley due to degeneration of the thyroid gland, while Lorand and numerous followers of his believe that it is caused by the degeneration of all the ductless glands, particularly the thyroid, adrenals and gonads The modern scientifically-trained biologist, however, cannot look upon senescence and old age as disease processes but regards them as a physiologic entity, the result of involution processes inherent in the organism The exact mechanism of this involution is, of course, the great problem, and concerning this there are various opinions The most important of these views may be briefly stated as follows -

Age is due to a loss of growth-energy, so that the cell loss exceeds the regenerative powers, and numerical and quantitative atrophies ensue This loss of cell growth is due, according to different workers to —

- 1, Increase of specific growth-inhibiting factors
- 2, Decrease of specific growth-stimulating factors
- 3, A combination of the two preceding causes, both acting conjointly

As to the source of these hypothetical specific substances there are wide variations of opinion, as follows

- a, Physico-chemical changes in the blood-serum (senesecent serum)
- b, Changes in the physico-chemical equilibrium of the organism (changes in the colloid states, in the water-content, in the pH, acidosis, alkalosis, etc.)
- c, Accumulation of toxic waste products of metabolism (chronic fatigue, auto-intoxication)
- d, Endocrinal disturbances, either a hypoactivity, hyperactivity, or dysfunctional production of abnormal toxic growth-inhibiting substances, disharmony in the pluriglandular endocrinal complex, loss of energy power due to loss of specific rejuvenating substances produced by the interstitial cells of testis and ovary
- e, Disturbances of the intrinsic conditions of the metazoan organism associated with differentiation of cell function. Loss of differentiation power, reversal of growth processes due to nutritional factors, changes in cell environment, etc.

A detailed critical review of these theories is not possible within the limits of this paper In general they are all built upon insecure foundations, hypothetical substances and hypothetical changes, that may be due to the processes of senescence and not its cause. Not a single one of all the theories of senescence so far offered has a leg to stand upon, for the greater part they are pure hypotheses constructed about some single fact, such as the increased growth-inhibiting power of the senescent's blood serum or changes in the pH, or some other similar uncorrelated observation Much has been recently made of the cultivation outside of the animal body of tissue and organ cells A potential immortality has been claimed for the somatic cell as well as for the germ cell—because of this, biologic hints of the possible immortality of the soma are thrown out by over-enthusiastic biologists and jour-It is a great temptation to enlarge upon this subject, but it is perhaps futile to pursue arguments aggressively for which there is so little, or no, biologic foundation The cultivation of tissue cells in vitro has precisely the same broad biologic significance as the cultivation of neoplasm cells It is a pathologic situation, and not a biologic one ther, all of the theories of senescence mentioned above are fundamentally wrong in that

A SURVEY OF HEALTH SERVICES IN EVERY COUNTY

The Committee on Public Relations of the Medical Society of the State of New York deals with the relation of the medical profession to the other health agencies of the State, and a similar committee of each county society deals with health agencies of the county The relation proposed by the State Committee is that physicians shall assert and assume the leadership in all forms of health work first essential of the activity of each committee is to survey the field in each county and to plan the additional health and medical service that the county requires Then when the survey of a county is made, let the committee publish its report in the New York State Jour-NAL OF MEDICINE for the benefit of the other counties and the officers of the State Society

A survey somewhat like the one suggested was made in thirty-three counties in 1924 and 1925, and was published in the Journal This survey was of direct value to the Committee on Public Health and Medical Education According to Dr C A. Gordon, the Chairman of the Committee, it was the principal source of the information on which the Committee based its work

The evolution of experience and plans during the succeeding four years suggests an extension of the plan of the former survey which covered the fields of private practice and hospital service, and did not enter deeply into the fields of public health, civic medicine, and medical publicity and education. One of the items of information that was sought in 1924 was the question, "What activities, besides those connected with its meetings, has your society undertaken?" The reply was frequent that nothing had been done But more recently the officers of the State Medical Society have stimulated the county societies to undertake new activities with the result that many societies have entered the fields of graduate education, medical publicity, public health nursing, prenatal clinics, and other health projects which medical societies can conduct

Four years ago the County Tuberculosis Committees of the State Charities Aid Association dominated the field of public health and medical education to the exclusion of the local physicians, and often the officers of the county medical societies could not tell the name of the President or Executive Secretary of the County Tuberculosis Committee Moreover, there were frequent disputes occurring between the doctors and the lay workers, largely because each group knew little of the plans and activities of the other Today, it is probable that there is some sort of agreement between the two groups in each county An example of the get-together spirit is the action of the Tuberculosis Committee of Washington

County in choosing a physician for president, thereby ending a long dispute between the physicians and the lay workers, and starting health work under the leadership of physicians. The action in Washington County is a commendable model for other counties, and yet no publicity has been given to it in the State Journal, and it is doubtful that the physicians of other counties know of it

The survey of a county is easy to make provided a suggestive form is devised. This form cannot be merely a printed questionnaire with spaces for statistical data and yes and no ans-The survey to be of value must be written in the style of an informal conversa-If one of us should meet a doctor from Franklin County, for example, he would inquire how the plan of medical publicity, discussed by the county medical society, is progressing. It may be that no publicity material has yet been issued or even prepared, but the chairman of the publicity committee can give an informal description of conditions which have led the county society to discuss medical publicity Since Franklin is one of the few counties that has discussed that subject, a report of what its society has done and plans to do will be of value to other societies

The following outline for a report is sugrested

gested

1 A brief record of the number and distribution of doctors, hospitals and clinics

2 The County Medical Society—the activities it has undertaken and its plans for the immediate future, such as anti-diphtheria work

3 The County Tuberculosis and Public Health Association, and its activities. Its relation to the medical society. The public health work that it does—children's camps, nursing, publicity, etc

4 Other lay health organizations, such as

Parent-Teachers' Associations

5 Social welfare agencies, such as Child Welfare, clubs interested in any phase of health work—Rotary, Kiwanis, fraternal, etc.

6 Health examination of school children, and the correction of defects. How much interest do doctors show in the examination of the children?

7 The local health departments Attitude of local health officers and boards of health

8 What are the peculiar health needs of the county?

The mere fact of attempting to record the conditions outlined in the suggestive questionnaire will reveal to the local investigator the limitations of his knowledge of his own county, and will stimulate him to devise practical plans that are adapted to his particular community It may be that the County Medical Society will

THE PATHOLOGY OF AGING

An outstanding contribution to the Graduate Fortnight of the New York Academy of Medicine during the first half of October was thatby Dr Warthin on The Pathology of the Aging Process This lecture was a fitting introduction to the series, because it afforded a basis for the correlation of the succeeding

lectures and clinics Dr Warthin considered old age conditions with logical simplicity and clearness Every reader of this Journal will be well repaid if he will turn to page 1349 and read the article, and when he has read it, he will wish to preserve it for future reference

MEDICAL PROGRESS

Certain Aspects of Tinnitus, Particularly Treatment.—Isaac H Jones and Vern O Knudsen discuss the mechanism, types and classification of tinnitus, and comment upon the unsatisfactory results of treatment tunately tinnitus is not necessarily an accompaniment of hearing impairment. An analysis of 340 cases of impaired hearing revealed tinnitus in 59 per cent of the cases, there being a particularly high prevalence of the condition associated with conductive lesions-63 Local treatment is limited to the external and middle ear, it consists in the removal of obstructions in the external ear and varied measures to improve the condition of the middle ear The best prospect of local treatment is in cases of tubal congestion Several of the best otologists have severed the eighth nerve or destroyed the cochlea, such operations are not without danger and are almost always unsatisfactory Possibly many have been less alert than they should have been in the use of constitutional treatment. In any marked defect of the cochlea search should be made for focal infection, especially if one cannot find any other cause of a previous tovemia, such as mumps, scarlatina, influenza, or meningitis Certain drugs have been empirically recommended for the relief of tinnitus, notably dilute hydrobromic acid in doses of one fluid dram three times a day in water, this may be combined with potassium iodide In cases of hyperthyroidism suitable treatment (thyroid extract, Lugol's solution) at times relieves the tinnitus that accompanies this dis-Similarly, tinnitus during the menopause may be relieved by ovarian extract the systolic blood pressure is low, digitalis or strychnine may give relief In cases of high blood pressure trinitrin has been recommended The writers have constructed two types of mechanical instruments which have afforded relief, though of course, they do not "cure" the tinnitus The first, termed "bombardment" of the cochlea, aims to desensitize the cochlea in tonal regions corresponding to the tinnitus The pitch and loudness of the tinnitus are determined by precise measurements, and an objective sound is then produced, of the same pitch as the tinnitus but of much greater loudness Of the second type of instrument two varieties may be used first is a monotone generator, constructed of a vacuum tube oscillator and loud speaker The oscillator is adjusted to produce a frequency slightly below that of a tonal tinnitus The other instrument consists of an ordinary 50 to 60-cycle alternating current conducted through a special loud speaker (magnavox type) and a telephone condensor connected in series. This produces a complex "spectrum" of tones which is capable of masking almost any tone or noise which may characterize a tinnitus — Laryngoscope, September, 1928, xxxviii, 9

Bismuth Intoxication From Beck's Paste in the Pleural Cavity -P Torrione reports a case from the surgical clinic at Lausanne It is of interest to note in passing that in 1882 Kocher saw the same accident follow the strewing of bismuth powder on wound granulations, and he at once abandoned the remedy At a much later period accidents of the same nature followed the application of dermatol and airol Beck introduced his paste in 1910 and occasionally saw untoward results In 1912 Mayer was able to find a record of 64 cases of intoxication with 24 fatalities from the surgical use The cause of the untoward reof bismuth sult is obscure and has been brought into association with arsenical impurities, the formation of toxic nitro-combinations (when the subnitrate is used), lack of asepsis, etc author's case metallic bismuth was used. The patient, a man of 55, had an empyema treated by operation and a 10 per cent paste was used in the cavity—150 gm of bismuth in all symptoms of intoxication appeared until six months later when a stomatitis developed, due evidently, to slow continuous absorption. This gradual, insidious, but relatively mild poisoning is believed to be characteristic of the bismuth 1011, while another, much more acute and violent, has been ascribed to the presence of some nitro-compound and is seen only after use of the subnitrate.—Schweizerische medizinische Wochenschrift, September 8, 1928

Paroxysmal Tachyarrhythmia. — L Gallavardin writes at extreme length on this subject, making six clinical varieties although under the head of treatment these are summed up as thyroidal and non-thyroidal. The author's own summary of his article is as follows. "Auricular fibrillation with complete arrhythmia, before it becomes permanent, manifests itself almost always in a transitory manner. Ordinarily the accesses of fibrillation are not perceived by the patient, but in certain cases there are manifestations which recall the paroxysms of Bouveret's disease. It is for the latter that the term paroxysmal tachyarrhythmia should be reserved, this in turn being

choose an anti-diphtheria campaign for its special effort, or will undertake the publicity of popular medical articles in the newspaper When a group of conscientious physicians, such as those which compose a county medical

society, realize the deficiencies in the medical service of the county, they will devise the means of supplying the needed service, and will supervise the execution of the plans

W H Ross

THE COMMITTEE ON PUBLIC RELATIONS

The preceding editorial is the report of the plan of action that was adopted by the Committee on Public Relations, at its meeting on November ninth. The Committee divided the State into five districts and assigned them among its members, each of whom will see that a committee on Public Relations is formed in every County in his district.

The first duty of a County Committee will will be to make a survey of the medical and allied services that are available in the County

Its second duty will be to devise a plan for supplying the additional medical services that are needed in that particular county, and especially to make working arrangements with all organizations engaged in health work in the county

A full account of the meeting of the Public Relations Committee will appear in the Journal of December first

Reports of the plans of the Committee will be prepared and will be available to each County Committee

THE MEDICAL INFORMATION BUREA

The instruction of the people in the aims and bojects of the medical profession is being considered in an increasing degree by the medical societies of the Counties and the State Medical leaders recognize the fact that the people must understand the ideals of the physicians in order to give intelligent support to

the public health plans of the laymen as well as the medical profession. The latest plan of publicity is that recently instituted by the joint action of the Medical Society of the County of New York and the New York Academy of Medicine and described on page 1377 of this issue.

LOOKING BACKWARD

This Journal Twenty Years Ago

Flies and Disease—The close relation of house flies to human disease was under investigation twenty years ago when the Merchants' Association of New York had just completed an extensive study of the subject, and had published its findings in a report which was beautifully printed and well calculated to convince educated laymen of the need to take precautions against in insects

This JOURNAL of November, 1908, contains an article on "Insects and Disease" by Dr John B Huber of New York, in which the author says

"We have long looked upon the house fly as a sort of necessary nuisance, as a sort of scavenger which people must put up with who will persist in uncleanly habits, it is only up to recently, however, that we have come to look upon it as a dangerous pest. Dr. Jackson, Fly Investigator of the Association for the Merchants, computes that in New York City it is the occasion of some 50,000 cases of sickness, of some 650 deaths from typhoid, and 7,000 deaths from other intestinal diseases. We look upon typhoid as an autumnal fever

Many an urbanite has returned from his vacation stricken with this disease, and the cause has frequently been assigned to tainted wells Wells are certainly from time to time at fault, but not so generally as is often assumed. If we count back two months from the fall rise in typhoid deaths to the time when the disease is contracted, it will correspond exactly to the curve of prevalence of flies and to the curve of rise in deaths from diarrheal diseases of both children and adults It will also correspond to the temperature curve, it is, therefore, erroneous to attribute these diseases to hot weather alone Chmatic condi tions may predispose by reducing the vitality, but they are not the essential cause, temperature does not produce the specific germ—the causal agent which invariably accompanies the disease. The activity of the house fly, states Jackson, is in proportion to the temperature, and the time when this insect is most active and most numerous corresponds exactly with the time of contraction of diarrhea and of typhoid fever"

within the cells and intercellular spaces, the cells and fibers finally disappearing in a number of adjacent areas Although there is evidence of cell proliferation, the authors are not of the opinion that ganglia are neoplasms Neither are they convinced that trauma plays a major part in their production Ganglia must be differentiated from tuberculosis of the joint or tendon sheath, lipoma, my oma, fibroma, osteoma, sarcoma, bursitis and aneu-The chief symptoms and signs are swelling, pain, interference with function, and tenderness So many ganglia disappear spontaneously or after breaking and pressure, aspiration and pressure, or aspiration and injection of a chemical irritant and pressure, that operative therapy is only indicated when nonoperative treatment has failed and when there are persistent troublesome symptoms or deformity Careful complete excision of ganglia under strict asepsis and with a bloodless field will probably not be followed by recurrence The entire cyst wall with all prolongations must be removed completely, no so-called pedicle should be tied off A firm bandage over the wound minimizes the chances of hematoma from an oozing capsule -Surgery, Gynecology and Obstetrics, October, 1928, xlvii, 4

Toxic Action of Milk Treated With Ultra-Violet Rays -R. Degkwitz enters into a controversy which seems to be in progress on this subject. The radiation of milk introduced into practice by Hess of New York, constituted an advance in pediatrics, the extension of which into other fields was inevitable. Thus in animal industry the propriety of raying food oils for cattle became involved and manufacturing chemists were influenced to place rayed preparations of different kinds on the market. In the past, as a rule, such sweeping innovations have called forth bitter opposition, but m this case the public and officialdom has made but little protest. However, it is important to know whether there are any chances for abuse of ready rayed preparations by the members of the public who purchase them, bearing in mind the tendency to overdose and use on wrong indication It has been surmised in different quarters that raying will destroy the vitamin content of the milk so that while seeking to prevent rickets we may be giving the children infantile scurvy The author is able to lay this ghost by showing the impossibility of such an event But the discovery that rayed milk may injure guinea pigs set other agitation afoot, though further experience brought out the fact that these animals could not tolerate cod-liver oil or olive oil A report that tuberculous infants and children do not take kindly to rayed products seems to have been confirmed, but even if true, this fact need not interfere with the general use of the principle The author believes that the experience of the coming winter will be sufficient to uphold the wisdom of raying food and medicinal substances as a general prophylactic measure.—Münchener medicimische Wochenschrift, September 21, 1928

The Treatment of Gangrene—W Sampson Handley calls attention to the fact that Leriche does not recommend his method of sympathectomy for actual senile gangrene Matthey-Cornat gives as definite contraindications for sympathectomy (a) the circulatory insufficiencies of generalized senile arteriosclerosis, with or without gangrene, and (b) arterial thrombosis and artentis obliterans Handley recommends alcohol injection, which he believes is a definite advance upon Leriche's oper-He claims that in certain cases it ation averts threatened gangrene or arrests the spread of semile gangrene already present, and removes the necessity of amoutation. In other cases it permits a low amputation instead of a high one. The technique of periarterial injection is not difficult, though it requires care The femoral artery in Hunter's and delicacy canal is exposed for a length of one or two With the finest possible hypodermic needle two or three minims of alcohol are injected at four points spaced around the calibre The needle is introduced of the artery obliquely and nearly parallel with the length In successful cases the vasoof the artery dilatation produced by the alcohol injection is This is not the only advantage, ımmediate for whereas the effect of sympathectomy passes off in about five weeks the vaso-dilatation following alcohol injection may last for a year or more Handley admits that the method is open to criticism, but his experience leads him to recommend it strongly in cases of threatened or incipient senile gangrene of a lower limb It should be applied in the prodromal stage before actual gangrene has occurred Extensive gangrene of the foot reaching to the leg is a contraindication unless the injection is followed by an immediate low amputation, since the increased blood supply may lead to fatal toxic absorption. It is also contraindicated if the foot above the dead area is congested and warmer than the sound foot Alcohol injection appears to be useless in Buerger's disease, and of doubtful value in Raynaud's disease — British Medical Journal, October 6, 1928, 11, 3535

Spontaneous Cure of Cancer—A Mathez of Berne, refers to a case of apparent spontaneous cure of a cancer of the lip reported last year by Avramovici He sought to account for this result by various hypotheses—successful defence by the tissues, formation of an antibody in the blood, the action of the bacteriophage,

one clinical form of a much larger group, that of complete transitory arrhythmias Paroxysmal tachyarrhythmia usually evolves in two The paroxysmal phase which may persist for a number of years, gives birth ultimately, by prolongation and fusion of the attacks, to the phase of complete permanent arrhythmia Despite the permanence of the rhythmic disorder, the patients are often less incommoded by the second than by the first The condition is in reality only a syndrome, the symptom of a cardiopathy, active or latent We call attention especially to the thyroid type and the juvenile form of the disease" The paper contains 20 clinical histories Under treatment the author lays down the rule that the case of thyroid origin demands treatment of the underlying condition, whereas in the non-thyroid form digitalis should always be given a trial with a view of preventing the paroxysms, while quinidine is of value in certain patients, either when the access first begins or between paroxysms However, the author does not lay down strict laws for using these and other cardiac drugs. but study of his cases shows that digitalis and quinidine are not given simultaneously, a period of the former drug being succeeded by a brief course of quinidine -Le Journal de Médecine de Lyon, September 20, 1928

The Importance of Diuresis in the Treatment of Certain Cases of Mercuric Chloride Poisoning—] M Hayman, Ir and I Priestley present evidence that the human kidney tubules possess marked powers of regeneration after acute mercuric chloride poisoning, and that the maintenance of adequate diuresis during the period of diminished concentrating ability forms an essential part of the treatment of mercurial nephrosis So far as they are aware the possible life-saving value of a high degree of diuresis during the stage of tubule regeneration has not been stressed They report the case of a man, aged 35 years, who swallowed five 71/2 grain tablets of mercuric chloride He was lavaged and placed on the Lambert and Patterson treatment. At the end of ten days, as his condition was extremely serious, this treatment was discontinued and he was given intravenous infusions of physiological salt solution of from 1650 to 2790 cc a day in addition to 3000 to 4000 cc of fluid This induced an increased urinary by mouth output, reaching a maximum of 3630 cc on the After five days of infusions the urea nitrogen had fallen to 175 mg per 100 cc and they were discontinued Progress thereafter was continuous and the patient made a complete recovery The biopsy findings in sections of the small bit of cortex removed at operation showed an extensive necrotic nephrosis similar to that found in the kidneys of patients dying within twenty-four hours after taking the poison—American Journal of the Medical Sciences, October 1928, clxxvi, 4

Tabes Psychoses —Prof A Bostrocm, of the Munich Psychiatric and Neurologic Clinic, refers in this title in part to the mental derangement which is called forth by peculiarities of locomotor ataxia, but the term is applicable to more than reactive phenomena With the supervention of the early symptoms we note the development of irritability, mistrust, hypochondriac fears, egoism, nagging, etc , while the ocular troubles may cause illusions But an organic element may be present, due possibly to the action of the toxin of the disease on the cerebral cortex There are not only these early mental peculiarities, but others which develop quite late in the course of the disease The question then arises as to the identity of this latter condition with what is known as taboparesis in which there is the association of tabes with paralytic dementia There has probably been some confusion in the past, but the author holds that at present this is hardly possible On the other hand some cases are chance associations with various psychoses and notably with dementia precox The term tabes psychosis should in the author's opinion, be restricted to cases in which lues is the essential factor although with taboparesis excluded Syphilis could conceivably produce organic mental derangement through endarteritis or chronic meningitis Cases are cited, the first of which was in a tabetic 47 years old, the mental symptoms consisting of restlessness and hallucinations The intelligence was intact Autopsy showed chronic meningitis. In the second similar case there was endarteritis In both these patients there was also a granular ependymitis same clinical and pathological picture may be seen in old syphilities without the presence of On this account the author thinks that as yet we are not entirely justified in using the term tabes psychosis, for the mental trouble should be peculiar to tabes to merit this name -Klinische Wochenschrift, September 30, 1928

A Study of Ganglion, with Special Reference to Treatment.—Louis Carp and Arthur Purdy Stout have made a careful study of the pathology and etiology of ganglia and present an analysis of 255 cases. They believe that ganglia are cysts resulting from mucinous degeneration of connective tissue. Ganglia generally occur in or attached to capsules of joints or tendon sheaths, but do not communicate primarily with joints or sheath spaces. The degeneration proceeds with fibrillation of the collagen fibers and accumulation of mucin

By LLOYD PAUL STRYKER, ESQ Counsel, Medical Society of the State of New York

THE BAR CLEANS HOUSE

The entire community is under a general debt of gratitude to Mr Justice Wasservogel for his conduct of the thorough-going investigation which he has now brought to a close Something of the extent of his work may be understood when it is recalled that 5,465 pages of testimony were taken at the public hearings, 5,315 pages at the private hearings, and that a total of 1,110 witnesses were examined at the hearings in the court room and in chambers

Mr Justice Wasservogel's report, which he recently submitted to the Appellate Division is an illuminating and valuable document. A condition was found to prevail among certain members of the bar which has shocked the conscience of the community. The men guilty of these reprehensible practices should never have been licensed to practice law. They have displayed a total inability to grasp the obligation resting upon a learned profession, or to appreciate even the most elementary obligations of good faith to their clients, to the community, and to the Courts of Justice of which they are officers

"Personal injury cases" says Judge Wasservogel, "have, in the main, come into the hands of relatively few lawyers, some of whom have conducted their practice purely as a business, to the detriment of the public and the profession 'Lawyers engaged in the practice referred to,' " continued Judge Wasservogel (quoting the lan-guage of Judge Dowling), "by themselves or through their agents who are sometimes laymen, promise to give to persons sustaining personal injuries some valuable consideration to induce them to employ such lawyers to prosecute claims for damages for their injuries Such lawyers, through their agents in some instances, maintain a wellorganized and effective system of solicitation by which they obtain prompt information of accidents resulting in personal injuries, from hospital employees, ambulance drivers, taxicab drivers and others who are so situated as to have early knowledge, and they pay them compensation for such information Solicitation for such business frequently takes place immediately after an injury has been received, often on the same day, in hospitals, in homes, and at the bedsides of injured persons, while they are in pain or otherwise distressed on account of their injuries'"

Judge Wasservogel's report paints a gloomy but truthful picture of the conditions prevailing among ambulance chasers, but his report will have a salutary effect, and is a fine demonstration to

the community, of how ready the legal profession is to purge itself of unfit men. Numerous disbarment and criminal prosecutions have been instituted and no doubt many of the offenders will find themselves either without their licenses, or facing a jail sentence, or both

The result of this will be not only to remove from the community the danger of these leeches, but to deter others, who but for this warning,

might have fallen into similar ways

There is one clause of Judge Wasservogel's report which should be of interest to the medical profession He says "A close connection is frequently found between the physician and the 'ambulance chasing lawyer In a great many cases the physician recommended the lawyer, and occasionally the lawyer suggested the physician some instances the testimony or certificate of the physician was used to bolster up claims for injuries which were never sustained, or were grossly exaggerated Existing laws are ample to reach the dishonest physician Aside from the provisions of the Penal Law, the recently enacted addition to the Education Law, entitled Article 48, gives the State Education Department control over the practice of medicine By the terms of this Article, the license of an offending physician to practice medicine may be revoked or other punishment imposed by the Department, upon the presentation of charges by the Grievance Committee created by that Act. Justices should promptly bring to the attention of this Grievance Committee, or of the public prosecutors, any improper conduct on the part of physicians"

The medical profession then has the same opportunity, and of course the same obligation, to purge itself of unfit practitioners, as that devolving upon the profession of the law

Some reassurance is contained in Judge Wasservogel's conclusion. He there says "It must not be assumed from this report that the abuses revealed in the 'ambulance chasing' investigation affect the profession in its entirety. Nothing could be further from the truth. The malign activities which were disclosed by this inquiry involve a relatively small part of the bar. My confidence in lawvers remains unimpaired. On the whole, their integrity is beyond reproach."

The writer takes this occasion strongly to commend the conclusion just referred to, and feels that it would not be improper for him to add that from his very widespread knowledge of the medical profession, that which has been said as to the

possible intercurrence of fever There is, of course, the possibility of a wrong diagnosis Mathez, apropos of spontaneous cure of cancer, adduces certain passages from a very recent article by Reding, a Belgian, on the acidbase equilibrium and the ionic equilibrium This writer states that cancer develops in a condition of alkalosis and hypocalcemia, which does not result from the presence of the growth but preexists and persists after its removal Cancer very seldom develops in a condition of acidosis A case is briefly cited of recovery from a cancer of the inner aspect of the cheek after radium and extirpation. While the operative wound was healing erysipelas developed, and for four weeks the temperature oscillated around 40c Eventually the wound healed A blood analysis then showed that an acidosis was present although ordinarily an alkalosis and hypocalcemia are found. Six months later with no evidence of relapse the condition of acidosis was still present. In this case the erysipelas or rather the continued high fever must be credited in part for the favorable result -- Lyon Chirurgical, July-August, 1928

Trauma As a Factor In Acute Appendicitis -Because of the fact that compensation for mjury has often been refused, Addison H Bissell thinks that trauma as a factor in producing appendicitis deserves attention Many cases of traumatic appendicitis have been re-Following the application of force to the external abdominal wall, it is easy to visualize a rush of cecal contents into the lumen of the appendix This force might theoretically rupture the appendix, but this undoubtedly seldom happens. It is also easy to visualize this force as causing mucosal or mucosomuscular tears, with fecal stasis, and rapid invasion of the appendix by pathogenic Concretions, strictures of the lumen and adhesions would increase the chances of this occurring To argue whether the organ was normal or not is beside the point. question should be whether an abdominal injury or unusual strain can precipitate the picture of acute appendicitis There does not seem to be any doubt that this can take place Bissell reports four cases in which trauma was the etiological factor in a series of 101 appen-At the time of injury all these patients were in good health and no history of previous attacks of acute appendicitis could There was in each case a definite history of severe trauma, with immediate abdominal pain, nausea, and vomiting symptoms were continuous up to the time of operation In each case a perforation opposite the mesentery was found in the appendix, and in each case a concretion was recovered which

presumably had penetrated through the appendix wall. It seems that trauma caused the concretion to impinge tightly in the lumen of the appendix, resulting in an obstruction, with hemorrhagic infarction, necrosis, and perforation on the antimesenteric border, bearing out the observations made by Van Beuren on mechanical ileus—Archives of Surgery, October, 1928, xvii, 4

Chronic Appendicitis —On the basis of deductions from clinical observation at the operating table and in the X-ray laboratory, Rea Smith advances the theory that the symptoms which we are accustomed to call "chronic appendicitis" have a larger pathology than appendical inflammation, that simple appendectomy will cure less than 50 per cent of these cases, that these symptoms are caused by a distinct surgical disease and are not to be laid at the door of neurasthenia, and that symptomatic relief may be obtained surgically in the same high proportion of cases as in diseases of the gall-bladder, the stomach, and the duo-The distinct surgical disease is that known as a Jackson's membrane. As this attachment becomes tighter, the colon is rolled to the right and twisted This twist so pinches the intestinal wall containing Auerbach's plexus that cecal dilatation with lack of peristalsis follows, and a spastic colon forward from the point of pressure develops toneless cecum, without haustra, dilated, and thin-walled, immediately regains its color, thickness, and peristaltic activity upon removal of the plexus pressure This observation disproves the theory of Lane that the cecum has become toneless through atrophy of muscle from hydrostatic pressure, and the theory that the muscle has atrophied through trophic changes from long toxemia, and also the theory of anatomical intestinal obstruction in the ascending colon Smith analyzes a series of 571 consecutive cases diagnosed "appendicitis," of which 186 were complicated by pericolic membrane which he thinks is usually not recognized and not disturbed at operation He has been unable to find any patient in this series in whom the symptoms persisted after The procedure which he employs consists in dividing the reduplicated peritoneum at the white line which marks its junction with parietal peritoneum. The edges of the longitudinal incision in the-peritoneum are separated four or five inches by the rolling out of the colon, which immediately draws up Into the denuded and regains its pink color area a free omental graft is implanted, its edge being stitched to the edge of the peritoneal in-This apparently prevents reformation of the constricting membrane -Annals of Surgery, Oct , 1928, lxxxviii, 4

properly unite with the breastbone, but there was formed a large bony lump near the breastbone at the point of separation from the broken ribs, to the plaintiff's damage in the sum of \$25,000

It appears that plaintiff while riding with several other men in an automobile collided with a The car tipped over and caught railroad train fire One of the men with the plaintiff was so badly hurt that he died Upon admission to the hospital where he was seen for the first time by the defendant, it was found that he was suffering from first degree burns of the face and neck, he also complained of pain in the chest to the left of the sternum Zinc oxide was applied to the burns The patient was immediately fluoroscoped and y-raved and given a thorough physical examination by the defendant These examinations disclosed that two ribs were loosened from the These were thoroughly strapped with adhesive tape He remained in the hospital for five days During this time the patient was personally attended by the defendant daily and received treatment from the nurses in the hospital, as well as the hospital staff The adhesive dressings were changed several times to get the ribs in the best possible position. The burns on his neck and face were dressed and taken care of by the defendant and the hospital staff Contrary to the defendant's instructions while at the hospital the patient insisted upon getting up and walking around

The patient had been in the hospital about five days when he expressed a desire to go home Upon examination he was advised that his ribs were not yet in exact apposition with the sternum and that he would have to be extremely careful if he went home. He was further told that he was not entirely cured and that he must see his family physician regularly and that the adhesive straps were to be removed after examination either by the defendant or some one in the hospital or by the patient's family doctor. He was advised by the defendant not to go home, but he insisted upon so doing When discharged the patient's chest was properly bandaged and he was instructed to see his family physician He never came back and was never treated by the defendant thereafter

When the case came on to be tried, the plaintiff took the stand, but after the defendant's counsel had cross-examined him his own attorney consented to a motion made by the defendant to dismiss the complaint. The motion was granted and the action thus terminated in favor of the defendant doctor

PEDICULOSIS PUBIS-CLAIMED IMPROPER INSTRUCTIONS BY DEFENDANT

In this case the patient complained of pain in small of back, frequency of urination and also a urethral discharge. He gave a history of having been treated for syphilis with mercury injections about eleven years before and told the doctor that his blood had been examined and that he had a Wassermann done which was found to be positive, further that he had been under treatment for urethral discharge and a burning sensation on urination for some time prior to his first visit to the doctor. Treatment for the urethral and prostatic condition was administered and after a few weeks his condition improved and then against the advice of the defendant the patient went to the country, remaining there for several months.

About ten months after his first visit to the doctor he returned with the same complaint as on his first visit. The doctor again instituted the treatment he had given him on his previous visits. At this time he also complained of an itching in the public region. An examination disclosed that the plaintiff had pediculosis public. The doctor advised the patient to get some blue ointment and to apply it gently over the parts involved before returning and to take a hot bath the following morning. He was instructed not to leave too much

of the ointment in contact with the skin. The patient did not return for about a week and then he told the doctor that he had applied the ointment indiscriminately and allowed it to remain on his person without taking a bath. This caused a marked burning of the skin for which the plaintiff was treated at a dispensary with some soothing salve. When the doctor saw him at this time there was evidence of dermititis which had subsided. The doctor saw the patient about two weeks later when the local condition had entirely cleared up and the doctor never saw him again.

Subsequently the patient commenced an action charging that the defendant unskilfully and negligently prescribed a certain salve containing a greater percentage of mercury than the human flesh could endure, and that after the plaintiff applied the said salve to his body it became inflamed, sore, burned and blistered, to his damage in the sum of \$10,000

The plaintiff's attorney on a number of occasions attempted unsuccessfully to negotiate with the defendant's counsel for a settlement, and finally just as the case was about to be reached for trial the plaintiff discontinued the action

1370 LEGAL

lawyers, could be said with equal truth concerning the medical profession

The particular practices revealed in connection with certain physicians, we believe, affects relatively few doctors. In spite of all of the disclosures, we are sure that confidence in the medi-

cal profession should remain unimpaired On the whole, their integrity is beyond reproach

It will however, add to the prestige of the medical profession, and assist in reenforcing public confidence, if the Grievance Committee fearlessly performs its duty

CLAIMED NEGLIGENCE IN THE REDUCTION OF A FRACTURE OF THE LEG

In this case, a man 67 years of age, was knocked down by an automobile and sustained a fracture of the leg about one-third up from the ankle joint Upon examination of the patient after the accident the doctor found a fracture of the lower and middle thirds of the tibia and an oblique fracture of the fibula at about the same There was marked deformity and crepitus on movement of the leg The doctor prepared board splints, one extending half way up the thigh and by the use of moderate manual extension the bones were brought into-correct apposition and the splints applied The doctor called the next day and took careful measurements of the leg and adjusted the tension of the bandages the third day the doctor found extensive vesicle blisters over a good part of the leg just above the point of fracture showing an extensive obstruction of the circulation as a result of the injury In about a week's time these vesicles cleared up The doctor saw the patient at frequent intervals for the next month The swelling gradually went down, the bone was knitting and the leg was in good shape for the patient's age

About three weeks after the accident the doctor replaced the longer splint extending above the knee by a shorter one that conformed to the shape of the leg. The doctor continued to see the patient and about two months after the accident in adjusting the bandages there was a slight give at the callus about the point of injury, instead of beginning bony union which the doctor expected to find. There was no shortening or deformity Upon examination about five days later there was more movement and slight deformity. The

patient complained of weakness in the other leg A few days after that the doctor examined an x-ray which had been taken a few days before which showed a marked deformity and partial displacement of the fractured bones that had taken place by contraction of the calf muscles against the softened callus at the point of fracture, which condition had occurred by reason of the plaintiff's constitutional disturbance brought on in part by the excessive use of intoxicating liquors during all of his adult life and during the period of confinement since his accident. At this time the doctor recommended that the defendant be taken to a hospital and have the bone plated and have further treatment so as to give the bone a better chance of union The patient said he would do this if the doctor paid the expenses which the doctor very properly refused to do, and the patient then told the doctor he would go where he felt like and discharged the doctor from the case.

Subsequently the patient brought an action charging that the defendant negligently treated the plaintiff in that he did not place the broken ends of the bones of his leg together and in a position so that they would properly unite, and it was further claimed that the defendant had permitted the broken ends of the bones of plaintiff's leg to remain separated and in a position where they would not properly unite.

Upon the trial of the case the plaintiff failing to produce any proof of negligence on the part of the defendant, at the close of his evidence on motion of defendant's counsel the complaint was dismissed

FAILURE OF PATIENT TO FOLLOW INSTRUCTIONS

The complaint in this action charged that subsequent to an injury sustained by the plaintiff in an automobile accident, he was removed to a hospital of which the defendant was the chief surgeon. That the defendant undertook to treat the plaintiff while in the hospital, but did so in a careless and negligent manner in that he failed to discover that two of the plaintiff's ribs were

fractured and separated from the breastbone, and discharged the plaintiff from the hospital as cured on the fifth day without bandages, plaster cast or other supports to hold the fractured ribs in position, and that neither the defendant nor any of his agents or employees gave the plaintiff any instructions as to future care, as a result of which it was claimed plaintiff's fractured ribs did not

NEWS NOTES

CERTIFIED MILK

A statement by Dr Paul B Brooks, Deputy Commissioner New York State Department of Health, Albany, N Y

Dr William Henry Donnelly, Assistant Professor of Diseases of Children, Postgraduate Medical School and Hospital, not long ago addressed a joint meeting of two organizations interested in promoting the use of certified milk, prefacing his remarks with the statement that he was "A physician first and nilk commission man a very close second" In the course of his address he said "It is perfectly true that one or two weak milk commissions give all the rest of the country a black eye I would be very glad, indeed, to see all the commissions not properly functioning, not up to the standard, wiped out by us, and not by the state health authorities"

A "certified" cap upon a bottle of milk is a guaranty of a county medical society that the milk has been produced and handled strictly in accordance with the regulations of the American Association of Medical Milk Commissions. For this guaranty the purchaser pays a premium of ten cents, more or less, per quart. If the terms of the guaranty are fully carried out both in letter and in spirit, extreme precautions have been taken and the milk is as safe as it is possible to make raw milk. Otherwise the purchaser of certified milk is the victim of an imposition.

At almost every meeting of milk sanitarians certified milk comes up for discussion. Statistics demonstrate and a majority of prominent pediatricians whose opinions have been reported to the International Association of Dairy and Milk Inspectors believe that, speaking generally, under present conditions, even certified milk is safer for infant feeding if it has been pasteurized or boiled. This is in a measure due to the fact, often mentioned in discussion, that some medical milk commissions are functioning inefficiently or not at all

Among the requirements which each medical milk commission in effect guarantees to comply with or enforce are the following

The herd must be tuberculin tested semi-annually, and all reactors immediately removed and the milk excluded,

The herd must be examined by a veterinarian at least monthly, any animal suffering from udder inflammation or any other disease must be removed immediately and the milk excluded,

The hands of milkers must be thoroughly washed and dried before each milking,

All new employees "except in case of most extreme emergency" shall be examined by a medical examiner before employment, and all necessary laboratory tests made and all such employees shall be examined weekly by the examiner "All necessary laboratory tests" should be interpreted to include nose and throat cultures and the examination of as many specimens as necessary to determine that an employee is not a carrier of typhoid or other enteric disease

The New York State sanitary code, in Regulation 23, contains the following

"No milk shall be labeled or designated as Certified unless it conforms to the requirements of the American Association of Medical Milk Commissions, is produced under the supervision of a milk commission appointed by a medical society chartered by the Medical Society of the State of New York and registered with the names and addresses of its members, with the State Department of Health, and unless a copy of the certificate of the medical milk commission has been filed with the health officer The county medical milk commission shall report to the health officer at least once in each month the results of all bacterial counts, health examinations of milk handlers, tuberculin tests and physical examinations of cows made during the preceding month" (The Department has ruled that these reports may be made through the district state health officers)

"Failure on the part of a county medical milk commission or its employees to function in accordance with the requirements of the American Association of Medical Milk Commissions, as set forth in its last published 'Methods and Standards for the Production of Certified Milk' or to comply with the requirements of this section, shall be deemed sufficient ground for refusal by the health officer to issue a permit for the sale of certified milk based upon its certification"

A California health officer, in an address referred to in a recent issue of Health News, commended these provisions and intimated that other States would do well to incorporate their equivalent in State regulations. They fix upon each local health officer responsibility for seeing that no certified milk is sold within his jurisdiction unless the established requirements have been fully complied with

LONDON LETTER

LONDON HOSPITALIZATION

August and September in London are holiday months. At the end of July the students go down from the Hospitals, the senior members of the Staff disperse on vacation, and the various medical societies close their doors until October

In a few days from now the new Session at the Hospitals will be inaugurated by the familiar Old Students Dinner, where old and young practitioners, all bound by the common tie of alma mater, dine together in the Great Hall and many a laudator temporis acti comments caustically on the young man of to-day Everyone has been away, everyone has tales to tell of his holiday, all are keen to know the chances of the "Rugger" team and-so come up from the University? Has that brilliant three-quarter come to us or gone to some rival Hospital? How can we replace such-and-such who has qualified and gone down? It has always been so, and always, let us hope, will be so, for sport is the strongest link between us all

The dull season has been enlivened by the meeting of the British Association at Glasgow At this annual meeting much excellent work is done, but certain discussions, and those not necessarily of the greatest value, are seized on by the popular press and become the sublect of newspaper correspondents Perhaps the subjects that were most widely discussed were Dr D N Buchanan's experiments in the use of Hypnotism to abolish nervousness at examinations, and the presentation by Professor Donnan of Professor A V Hill's work on the maintenance of life in the cells former provoked the activities of the humor 1st, the latter led to an outcry that science was on the point of discovering the origin of Professor Donnan rather gave the lead to these enthusiasts, and Professor Hill had to intervene with the delightful explanation that Professor Donnan was "An Irishman and a poet" Professor Donnan remains impenitent

Soon after the re-assembling of Parliament, a Bill reforming Poor Law Administration is to be brought forward. One of the many effects of this Bill, if passed, will be the abolition of the Boards of Guardians, in whose care at the moment is placed the Poor Law Infirmaries. The place of the Guardians will be taken by the County Councils and it is thought probable that a great change will result in the organization, equipment, and

working of those Infirmaries It is true that of late years much progress has taken place in the medical side of the work, and the financial side has always been beyond criticism, but though the more progressive Infirmaries are now almost comparable to the voluntary Hospitals, this is not true of the These are still understaffed, both majority on the medical and the nursing sides, make little or no provision for the special departments, including pathology, and have no machinery for arranging consultations in difficult These deficiencies are gradually disappearing and special departments are being formed, and some consultants are attached to the medical staff The nursing, too, has improved and the training is on a par with that obtainable at the voluntary Hospitals As this levelling up process continues, the question naturally arises of the future relationship of the voluntary Hospitals and the The voluntary Hos-Poor Law Infirmaries pitals of London have grown up in a haphazard fashion Most of them were founded over 200 years ago when London was a comparatively small town Some Hospitals have since been erected in the outlying suburbs, but they were not placed with any view to the future needs of a spreading population The result is that some parts of London are over-supplied and others under-supplied with voluntary Hospital beds, and necessarily their spheres of influence overlap. The number of beds is insufficient to meet the demand on them, with the inevitable result that delay in admission occurs. After their re-organization the Poor Law Hospitals must come into keen competition with the voluntary Hospitals, for in addition to the other facilities, they are not hampered by want of funds They may even be able to suborn the young consultant away from the voluntary Hospitals by the offer of a substantial salary This might have a very serious effect upon the teaching of students and indeed upon the status of the voluntary Hospitals, whether teaching Hospitals or not There seems to be an opportunity for a compromise, and already there is in existence a working agreement between one of the teaching hospitals and a Poor Law Institution Much good should result from a scheme which would open out for undergraduates and postgraduates a vast and at present unused mass of clinical material

H W CARSON, FRCS, Eng

three papers discussing the increase and causes of mortality following certain abdominal operations Some other papers differing from the ordinary scientific series were "The Doctor and the Law," "The Evolution of Medicine," "The Coming Generation," "Public Health Creed," and "Medical Supervision of Schools in its Relation to the Practice of Medicine"

The officers of the State Society were accorded places on every program. These included the President, Secretary, Speaker of the House of Delegates, who spoke on group insurance, and the Chairman of the Committee on Public Relations. Dr. Ross spoke at two of the meetings upon the general subject of "The Creation of a County Health Unit." The Chairman of the Committee on Public Health and Medical Education and the Chairman of the Committee on Medical Economics, pre-

sented outlines of their work at several of the meetings

Every district did something toward promoting sociability among its members the Third District the Columbia County Society, acting as host, prepared a clam steam In the Fourth District the St. Lawrence County Society, acting as host, entertained the members at dinner at the country club Fifth District provided a luncheon for those in attendance, at the Hotel Utica where the meeting was held The Sixth District was served an elaborate luncheon at the Arnot-Ogden Hospital where the meeting was held. The Seventh District provided a luncheon at the Oak Hill Country Club, where the meeting was held The Buffalo City Hospital served a buffet luncheon to those attending the Eighth J S Lawrence, District Branch meeting Executive Officer

ORLEANS COUNTY

The annual meeting of the Orleans County Medical Society was held on October 4, 1928

The action of the State Sanitary Officers Association regarding automobile insignia was approved

The Post-graduate lectures to be held in Batavia October 15-28 were approved and will be attended by the members

Officers for the ensuing year were elected as follows

President-F W Scott, Medina

Vice-President—R. E Brodie, Albion Secretary-Treasurer—R. P Munson, Medina Censors, Membership Committee—J F Eckerson, Medina, D F Macdonell, Medina, L G Ogden, Holley

The scientific portion of the program was furnished by Dr A A Jones of Buffalo, who reported several interesting cases from his medical services, and Dr Wm F Jacobs of Buffalo, who read a paper on "Thrombosis"

Fifteen members and guests were present.

ROBERT P MUNSON, Secretary

BLIND BABY CARE

The State Legislature of New York, has granted a budget sufficient to care for 35 blind babies and young children, in the Institution maintained by the International Sunshine Society with Headquarters at 96 Fifth Ave, New York City

Mr Edwin Gould has just finished building two large playrooms 20 by 20 as additions to the Edwin Gould Kindergarten Annex, making exceptional schoolroom facilities for these little folks

The State Board of Education has sent to the Sunshine Arthur Home and Kindergarten since its opening 95 children. They are taken in generally as wee babies and they can graduate at eight years for the State or City School for the Blind if they are physically strong and mentally bright. Two little girls, one from Rochester and one from Little Falls, have entered the State School this year. Both are away ahead of the seeing children at their age in their studies.

In counting up the New York children, there are 9 children from the first district in the Brook-

lyn Home The other children all being outside of the City of New York, are sent to the Arthur Home as follows From the 3rd District, 3 children, Fourth has sent 4, Fifth has sent 7, Sixth has sent 2, Seventh has sent 9, Eighth has sent 2, Ninth has sent 8

As a child leaves or graduates, its crib is immediately given to some child on the waiting list. If this item reaches the eye of any mother who has a blind baby or a young blind child too young for the State Schools she should communicate immediately with Mrs. John Alden, Sunshine Headquarters, 96 Fifth Ave., New York City, and she as Honorary Chairman of the Blind of the New York State Federation and Chairman of the Blind of the City Federation of Women's Clubs, will help in every way possible to get the little one properly appointed by the State Board of Education.

Anybody knowing of a wee blind baby should feel it her duty to tell the mother that now New York State and City gives special care to these little ones

REVIEW OF THE DISTRICT BRANCH ANNUAL MEETINGS

Seven of the eight District Branches have held their annual meetings for 1928 and the Second District is planning its meeting for the first week in December Last year there was noted a very marked increase in attendance at the annual meetings as compared with the previous year Further comparison was not possible because of lack of data

It is gratifying to note that the general attendance this year surpasses that of last year. In the six up-state Districts, only two registered a smaller percentage of their members than in 1927, and none as few as in 1926. One of the Districts in which the attendance did not reach last year's mark is the Fourth, but this can well be due to the fact that last year's meeting was held in the center of its densest population, while the meeting this year was held in Ogdensburg, more than one hundred miles from where seventy-five per cent of the membership resides

The Sixth and Seventh Districts carry the palm for attendance, having respectively thirty-two and thirty-three per cent of their membership registered. In area, the Sixth District is much larger than the Seventh, but approximately ninety per cent of its members live within one hundred miles of Elmira, the place of its annual meeting. The compactness of the Seventh District is even more marked and probably ninety per cent of its members live within seventy-five miles of the meeting place. But undoubtedly the programs of these two sections were great factors in determining their large attendance.

A comparison of the attendance by members at the annual meetings of these six Districts, shows that in 1926, 400 members, or 10 per cent of the membership registered at the annual meetings, in 1927, 722, or 18½ per cent registered, and in 1928, 776, or 20 per cent, registered In addition to the members of the District, the total attendance always includes some lay visitors and some physicians of other Districts interested by the programs which appear in the Journal, and not a few physicians who are not members of the Society and who come, attracted by the programs which they read in the local papers

It is also interesting to compare the attendance at the annual meetings of the State Society with the annual meetings of the District Branches In 1927, from these six District Branches—the Third to the Eighth inclusive—480 members, or 12 per cent, attended the annual meeting of the State Society, while 722, or 18½ per cent of the total membership, attended the District Branch annual meetings In 1928, 638, or 16 per cent, from these Districts, registered at the annual meeting of the

State Society, while 776, or 20 per cent of the membership, attended the District Branch meetings Contrary to what one usually supposes, the two groups are made up largely of different physicians Probably less than thirty per cent of those registered, attended both the State Society meeting and the District Branch meeting in either of the two years These figures indicate that the District Branches, through their annual meetings, do make a definite cantribution to the scientific opportunities of the members of the State Society

-- estimated, registration was not complete.

Comparison of attendance at the annual meetings of Six District Branches and the State Society

The table shows the number of physicians registered from each District, and the percentage which the registration bears to the membership of each District.

The programs, as a whole, were unusually attractive this year. The Eighth District held its meeting at the Buffalo City Hospital, where in the forenoon ten clinics, or clinical conferences, were conducted. More physicians attended the clinics than stayed for the scientific papers in the afternoon. For the last two years the Fourth and, in 1927, the Third Districts, devoted a half day to clinical conferences and had similar experiences with regard to attendance and interest.

Some programs contained highly scientific papers on such subjects as, "Laboratory and Clinical Methods for Cardio-Vascular Studies," "Studies on Breast Cancer," "Recent Advances in the Treatment of Fractures" Two programs included papers on "Plastic Surgery" and two papers on "Diagnosis and Treatment of Infections of the Hand" Some of the papers treated subjects of immediate interest to the physician, namely "Poliomyelitis-Fundamental Facts" "Differential Diagnosis of Menopausal and Post-Menopausal Hemorrhages," "Ear Infections in Children," "Diagnosis and Treatment of Common Skin Diseases," "Undulant Fever," and "Serum Treatment of Pneumonia

The programs have not, however, been entirely scientific. From time to time each has had some papers on economics of the practice of medicine. This year four districts had papers bearing upon the high rate of mortality which attends maternity in this state, and

BRONX COUNTY MEDICAL SOCIETY

A regular meeting of the Bronx County Medical Society, held at Concourse Plaza, on October 17, 1928, was called to order at 9 P M, with the President, Dr. Gitlow, in the Chair

The following new members were elected Drs Herman L Robbins, Maurice A Shapiro, Philip

Slater, and Morris Stahl

Reports of Committees being in order, the Secretary presented the Report of the Nominating Committee In accordance with Section 82 of our By-Laws, the Nominating Committee suggested a full set of Officers for 1929

The President presented Dr Edward R Cunnifie, President of the First District Branch, who outlined the program of the Annual Meeting of the First District Branch, which is to be held at Briarcliff Manor on Thursday, October 18th, and

A MEDICAL INFORMATION BUREAU

A Medical Information Bureau has been established by the New York Academy of Medicine and the Medical Society of the County of New York, with headquarters in the building of the New York Academy of Medicine, 2 East 103rd Street, New York Telephone, Atwater 4700 The objects of the Bureau are set forth in a

printed announcement as follows

"The recent and phenomenal progress of modern medicine, and particularly of preventive medicine, necessitates the development of a direct and intimate channel of communication between the practitioner and the community. This is essential, not only that the public may learn to take advantage of the constant advances of modern medicine, but to the end that it may be protected against the hordes of charlatans, quacks and misguided zealots who, strange to say, thrive more than ever in this day of presumptive enlightenment.

"In appreciation of the needs of our day and society, the New York Academy of Medicine and the Medical Society of the County of New York have established a joint Medical Information Bureau. The aims of this Bureau are to facilitate the dissemination of authentic information on medical and public health matters, to stem and curtail quackery and to promote a better understanding between the public and organized medicine.

"The Medical Information Bureau is supervised by a Committee representing the Academy and the County Society. It is served by a body of over one hundred consultants competent to give expert opinion on a variety of questions relating to their specialties. The full resources in judgment, knowledge and experience of the medical profession in New York are "on tap" to aid its purpose.

"The Bureau's first obligation is to serve the press of the city, and it has been organized in such a manner as to facilitate this service. It hopes, however, that every organization concerned with the dissemination of information to the public as a whole, or to select groups, will feel free to call upon it for the type of assistance it is ready to give."

The Kings County Medical Society established a similar publicity service at its meeting of March, 1924, when the entire program was on the relations of the medical profession to the press. The papers that were given at the meeting discuss all phases of the relation of the physicians to the press, and are published in the October, 1924, issue of the Long Island Medical Journal. The speakers included Arthur Brisbane, and the Editors of the leading daily newspapers of Brooklyn The editors and the physicians were agreed on the desirability of the appointment of a committee of doctors who would be ready to grant interviews to newspaper reporters on any medical subject, whenever their opinion should be asked

A committee, called the Press Reference, was appointed at the meeting, and has functioned actively ever since. The leading newspapers have recognized the committee to such an extent that they await its opinion before publishing an important article on a new subject, such as the value of the Johns Hopkins investigation into common colds.

Another example is that of publicity in the cancer campaign. The newspapers of Brooklyn took little notice of the copy sent to it by the Cancer Committee, until the Press Reference Committee approved the copy and requested the newspapers to publish it. The result was extensive publicity in the press throughout all Long Island.

1

THE DAILY PRESS

THE RURAL DOCTOR

The problem of medical service in rural communities has come to the front in Albany County, which one does not usually consider as rural But the townships surrounding the growing cities are likely to be more rural than those fifty miles away. The rural towns within sight of the dome of the State Capital are being depleted of the farmer folk and the land has not yet been taken up for factories and building sites. The New York Sun of September 27 thus describes three of these townships

"For many years the people of Berne, Knox and Westerlo, adjoining townships in Albany county, have been served by physicians resident in Westerlo and Berne Dr Harold H Walker has moved from Berne and Dr Jasper Mead of Westerlo died recently The community formed by the townships is now without medical service

It has 3,600 inhabitants, among whom are what the State Health Department describes as "two excellent practices' as well as three positions for physicians who are qualified to act as health officers

"The townships are in delightful country The Helderbergs rise to a thousand feet in altitude and record the Dutch flavor of the countryside Hunting and fishing are at hand. The State Capital, with its treasures in schools, libraries, society, lies within striking distance. In the Hudson Vallev modern industrialism shoulders shrewd rural life. Saratoga Springs, with its known but neglected medicinal waters and its beautiful race course, is a pleasant jaunt afield. General practice in rural districts is hard work, but it has rich rewards for the man whose disposition fits it."

MEDICINAL HERBS

This is the season of the year when the attic of the old-fashioned healer was festooned with his collection of potent herbs, and he was digging the roots which contained the concentrated virtues of the dead plants. An editorial writer in the New York Herald Tribune of September 17, discusses medicinal herbs and says

"Fresh country air is doubtless a good therapeutic, and gardens in general are good to look upon, but there is a lack of precision in the modern nature cult. In the old days every plant had its peculiar 'virtues,' and every countryman and countrywoman knew what plants were good for what disorders. We buy pennyroyal at the druggists when the mosquitoes are too pestiferous, but our ancestors picked it in their gardens, and they had a catalogue of curatives of which we degenerate moderns know nothing. They were not even content to treat diseases with their simples, they were even ready to affect dispositions."

"Sweet marjoram, said William Gerard more than three hundred years ago, is good for those who are given to overmuch sighing,' and 'the smell of basil is good for the heart. It taketh away sorrowfulness, which commeth of melancholy and maketh a man merry and glad' Sweet marjoram, indeed, was one of the choicest of herbs.

"Such theories af medicine must have given to the old gardens an interest they lack today, but some of the prescriptions inspire something akin to fear as well. Here, for instance, is a Saxon recipe for an herb bath, prescribed for many ills

"'Take bramble rind and elm rind, ash rind, sloethorn, rind of apple tree and ivy, all these from the nether part of the trees, and cucumber, smearwort, everfern, helenium, enchanter's nightshade, betony, marrubium, radish, agrimony Scrape the worts into a kettle and When it hath strongly boiled boil strongly remove it off the fire and seat the man over it and wrap the man up that the vapor may get up nowhere except only that the man may breathe bathe him with these fomentations as long as he can bear it. Then have another bath ready for him, take an emmet bed all at once, a bed of those male emmets which at whiles fly they are red ones, boil them in water, bathe him with it immoderately hot Then make him a salve Take worts of each kind of those above mentioned, boil them in water, smear the sore limbs, they will soon quicken Make him a ley of alder ashes, wash his head with this cold, it will soon be well

"One can only hope that it may have been"

MEDICAL WARES

RADIO INTERFERENCE BY X-RAY MACHINES

The effects of X-ray machines upon radio reception have become so well known that the prevention of the interference is a serious problem wherever X-ray machines are operated Since there are at least five hundred times as many radio sets as there are X-ray machines, the radio fans sometimes demand local protection against the interference. Fortunately some of the newer types of X-ray machines do not cause interference, and when they have come into general use, there will be no more radio interference from that source

The X-ray machines which do not produce radio interference are those which contain no spark gaps or moving parts, but whose rectification of current is done by means of a valve tube rectifier such as that described in the Department of Medical Wares of this Journal of January 15, 1928, page 104. The principle on which the valve tube rectifier operates has been known for over twenty years, but it is only recently that valve tubes could be made to stand the high voltage which is necessary for producing X-rays. Standard X-ray machines using the valve type method of rectification are now on the market and will doubtless come into general use.

When an electric current is made or broken suddenly, an induced current jumps across the gap in a series of oscillations back and forth, thousands or millions of times a second. These oscillations set up ethereal waves that activate radio sets at distances depending on the power of the sending station.

The broadcasting stations generate waves which are uniform within narrow limits of variation Tuning the radio receiver consists in adjusting the instrument to respond to the particular wave length of the sender, but an X-ray machine using a spark gap produces waves of variable lengths, some of which are sure to influence near-by radios. It has often been a serious game among radio fans to guess which doctor was operating his X-ray machine when interference comes in

Since radio waves are produced only by arcs of high tension electricity, jumping across spark gaps, the elimination of the gaps and the making and breaking of the electric current will also eliminate the interference of the machine with radio reception

The introduction of X-ray machines free from radio interference has been a public benefit. The interference became so acute in the city of Portland, Oregon, that the Government

passed an ordinance that X-ray machines could be operated during only certain hours, excepting in emergency and then only when the Doctor received permission from the City after reporting a case But one doctor claimed that he had a new type of X-ray machine that did not have any effect on the radios, and requested that a local broadcasting station should test his machine The radio company accordingly set up and operated his X-ray machine close by a radio receiving set, but could not detect any interference with the The Mayor then interpreted the law to apply only to X-ray outfits that generate radio waves

The question of radio interference also came up in a small city in Michigan, where an X-ray specialist was located in the midst of a residential section in which every house contained a radio. The X-ray specialist was also a radio fan and the interference disturbed his own family quite as much as it did the neighbors. The doctor tried many corrective measures with no avail, until he found the type of X-ray machine which did not produce radio waves.

When a doctor buys an X-ray machine, its freedom from radio interference is an important point to consider if the Doctor wishes to retain the good will of his neighbors

But X-ray machines are not the only disturbers of radio transmission and reception Any sudden making and breaking of an electric current produces waves which may affect a radio set. Even the turning on or off of an electric light produces a perceptible click in a nearby radio. The ordinary alternations of a house current do not produce the waves, because the variations of the current take place with comparative slowness and without spark-

Doctors operating electrical machines which are defective may produce sparks which set up waves of radio interference. A physician who uses a high tension current, such as that of static machine, can reduce interference by operating it at hours when there is the least broadcasting. A physician has no justification for imposing unnecessary annoyance on his neighbors. If an emergency requires him to produce radio interference, the people would be only too glad to shut off their radios for a while, but most electrical treatments are not given for emergencies, and public-spirited doctors will use every effort to prevent annoying their neighbors.

BOOK REVIEWS

Surgical Clinics of North America Vol 7, No 4 August, 1927, Vol 7, No 5, October, 1927 Published every other month by the W B Saunders Company, Philadelphia and London Per Clinic Year (6 issues) Cloth, \$1600 net, paper, \$12.00 net.

Vol. 7, No 4, August, 1927 (The Brooklyn Hospital umber). This number is of interest both to the sur-Number) geon and the general practitioner Though several of the subjects treated in this issue are of limited practical value because of their extreme rarity, the majority of the articles are of great practical and scientific importance and interest. The articles on osteomyelitis, thrombophlebitis complicating mastoiditis and on the rapid identification of the Bac. Welchii, as well as many others are full of valuable information. The issue is well prepared and illustrated and represents the work of a hospital alive to the newest and best ideas in medicine and surgery

Vol 7, No 5, October, 1927 (Pacific Coast Surgical sociation Number) This issue brings to us the Association Number) ideas and work of the best known clinics of the Pacific Coast. The cancer problem as met with in the large intestine is dealt with in detail, so is the present status of thoracic surgery in tuberculosis of the lungs and bronchiectasis The evaluation of Pain in the differential diagnosis of diseases is well outlined and discussed. The numerous other articles are well chosen and will be found very helpful in the many puzzling problems the active surgeon meets with daily Geo Webb active surgeon meets with daily

THE INTERNATIONAL MEDICAL ANNUAL. A Year Book of Treatment and Practitioners' Index Forty-sixth Year, 1928 Octavo of 574 pages, illustrated New York, William Wood & Company, 1928 Cloth, \$600 This volume deals particularly with the therapeutic ad-

vances made during the year 1928 The application of liver to pernicious anemia, insulin in diabetes, malaria treatment of general paresis, lumbar puncture in status epilepticus, the use of cardiozol, novasurol and strophanthin in the treatment of cardiac

decompensation are thoroughly discussed

Isolation in Pneumonia is advised Thorough discussions of liver function test, tuberculosis of the lungs, bronchiectasis, rickets, angina pectoris and splenectomy

The treatment for varicose veins, infections of the face, tuberculosis of the spine, carcinoma of the colon, carcinoma of the bladder, stone in the kidneys, are valuable additions

The use of Veronal in cocaine poisoning, radium in malignancies are particularly mentioned

M A RABINOWITZ

COMMENT CONSULTER? By LEON SCHEKETER. Second Edition. Octavo of 170 pages Paris, Gaston Doin et Cie, 1928 Paper, 15 francs

The author calls his little work "A General Interrogatory. In the form of a series of questions and answers, he presents his ideas in a very striking way, pointing out the importance of properly conducting a medical examination and the taking of the history. It would seem that too little is taught the medical student and interne regarding the actual handling of patients Many a well intentioned attempt at history taking is frustrated by antagonizing the patient, or the guardian in the case of a child, and many irrelevant things frequently crowd out the more important ones. The time will undoubtedly come when the medical student will leave his Alma Mater with at least some idea of how to write on medical subjects with some degree of correctness, will know how to handle patients so that he may elicit the most satisfactory knowledge of a case, and last of all, will be able to conduct the comparatively simple business side of his medical practice in the proper way Until this time, such works as the one under consideration here, will continue to have a very valuable mission

THE OPIUM PROBLEM BY CHARLES E TERRY, MD. and MILDRED PELLENS for The Committee on Drug Addictions in collaboration with The Bureau of Social Hygiene, Inc., New York. Octavo of 1042 pages Published by the Committee at 370 Seventh Avenue, New York City, 1928

In The Opium Problem the reader has a volume to which three years have been given for the purpose of testing its data. Behind those three years of scientific analysis and criticism lie many times that number devoted to the accumulation and shaping up of the materials in this study of some one thousand pages in length And behind all the years of preparation and waiting which have gone to the making of this book, he the dis-tinguished achievements of Dr. Terry in practice and in surveys in Jacksonville and elsewhere.

Comprising chapters on extent, development of the problem, etiology, general nature, pathology symptomatology, types of users, treatment, and control international as well as national, state as well as municipal, the volume suggests completeness—even finality Nevertheless the chapters on etiology, pathology, and treatment, remain incomplete. And to their authors, as well as to their readers, they must be unsatisfactory. In this circumstance is not only one of the most significant traits of the book but also a feature most certain to win the confidence of students of the opium problem. At no time is there attempt on the part of the authors to use any fact or group of facts to point the moral and adorn the tail (?) of any "school" or any conclusion These incomplete chapters contain practically all the available matter of importance, and they fail to answer questions adequately From the data of the chapter on treatment for example, it becomes plain that treatment today is essentially empiric and without evident physiologic or anatomic basis, and that those physicians who are dealing with drug addiction, however scrupulously, have no guide to direct them but their experience.

For the reader desirous of a well-grounded education in the history of the opium problem, one of the indispersable chapters of the fourteen may well prove to be Chapter II on The Development of the Problem—the first sequential story of the history ever published This chapter acknowledges its debt to Dr David I Macht of Johns Hopkins and his brilliant articles in the Journal of the American Medical Association

The book is without bias, whether medical, psychologic or social. It does not contain a page in which there is any of the moral frothiness of the popular treatise on the menace of opium. Nor is it limited by being a physician's handbook. It is not overstatement to say that the one thousand pages of The Opium Problem make it possible for student and addict alike to escape from all the moral and political clap-trap about opium into scientific kindness—a kindness without pretence whether with regard to its ignorance or its knowledge From first to last this epoch-making volume, published by The Bureau of Social Hygiene, maintains an unhindered motility, moving without rancor, without prejudice, through the welter of political and social and scientific difficulties which have accumulated around the

JEANNETTE MARKS

opium problem.

RURAL DOCTORS AND QUACKS

The alleged scarcity of competent physicians in country districts and the rising cost of medical service everywhere are frequently discussed by groups of doctors as well as social workers. The New York Herald Tribine of October 15, commenting on an address given by Dr. Mayo recently before the American College of Surgeons, discusses the subjects editorially and draws some conclusions which are unusual. It says

"Perhaps the chief evil of the high cost of medical education and of medical service is that the well prepared physicians are mostly where we need them least, that is, in the cities Country towns tend every year to have fewer good doctors. Many have none. Only from lucrative specialties in centers of population can the able physician hope to recover a financial profit on his considerable invest-

ment Medical distribution is wrong, cities have more good doctors than they need, small towns and the country have too few No one, so far as we knew, has suggested any really promising remedy for this situation, and Dr Mayo, we gather, is equally unwilling to write a social prescription. If any one has thoughts about what to do to redistribute the country's doctors, let him think them soon."

Medical societies are discussing this question of the distribution of doctors, especially in the Middle West. One remedy proposed is a shortened course of study (see this Journal, October 15, 1928, page 1258). The President of the Missouri State Medical Association says that a rural community gets the kind of doctor it prefers (page 1190 of October 1 issue of this Journal).

BAD TEETH IN ANCIENT TIMES

It has long been the custom of popular writers on health topics to quote the prevalence of decayed teeth as evidence of the degeneration of the human race, for according to them, all early people and primitive races at the present time had sound teeth. This is an example of zeal and logic without a scientific basis, for decayed teeth are now and always have been, an affliction that spares no race. An editorial in the New York Times of November 7, discussing this subject says

"Science has been rudely shattering fancies, among them the one that aborigines are always perfect physical specimens, but it is only of late that the distressing condition of their teeth has been brought out El Palacio, a little periodical devoted to early American pre-his-

tory, gives some definite data about the dental situation among the Indians of New Mexico about 1500 B C. They suffered the same as we do, their teeth were subject to the same distresses. They even had pyorrhea, and probably five out of five was the proportion

"El Palacio says that the reason for this is hard to determine because their food was meat and grains, such as we use today," yet huge cavities developed in unworn teeth. But the worst thing about the tooth troubles of these original New Mexicans is that they had no dentists worthy of the name. With not even a subway ad to warn them what was happening, the plight of these early people was much sadder than our own"

DEBUNKING PUBLIC HEALTH

The New York Herald Tribune of October 25 quotes Dr Shirley W Wynne, Commissioner of Health, as saying to the New York Nurses Association

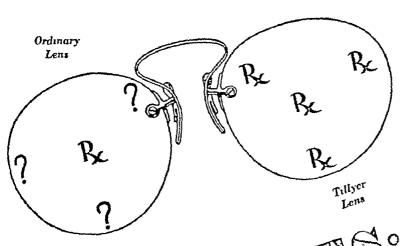

"We have been placing too much emphasis on the selling of the idea of public health and not enough on actually delivering the goods—on dispensing public health. The greater part of the reduction of tuberculosis cases comes solely from steadily improving economic conditions, and only a small part from public health work. That may sound like a startling

statement from a public health officer, but it is true"

Commenting favorably on the address, the newspaper says

"This utterance of Dr Wynne will inspire public confidence and assist him in the tremendous task which he has taken up. When he gives general prosperity rather than the efforts of the Health Department the credit for the reduction of disease he speaks a simple truth. And a man who tells the truth can be

trusted"

LL THE WORDS we could write and all the pictures we could print would not take the place of two or three days' experience with Tillyer Lenses before your own eyes. The only way you can know how much better Tillyer Lenses are is try them. Will you? Then you'll know that more accurate mare gins, and a precision non-elastic polish such as given to fine camera and telescopic lenses, make it worth while for you to write "Tillyer" on Prescriptions for your Patients.

OUR NEIGHBORS

THE TEXAS STATE JOURNAL OF MEDICINE

The leading editorial in the Tevas State Journal of Medicine for October discusses the question "To print or not to print," and states the principles which govern the editor in his presentation of articles. The following paragraphs will be of interest to doctors of New York State—Editor's Note

"Concerning the 'state' journals and the class of scientific articles they must publish, it is quite clear that if the general run of practicing physicians are not encouraged to write and read scientific papers and secure the publication of scientific articles, they will soon cease to make the kind of accurate bedside observations and case records that the production of medical literature absolutely requires Thus not only will medical literature in the long run seriously suffer, but the quality of practice on an average will be reduced might transpire that the present generation of accomplished writers will pass on, with few satisfactory followers Not many of us appreciate the importance of this phase of the situation

"The scientific articles in a publication comprise only a part of its attractiveness. There are the editorial comments, which should be carefully thought out discussions of problems of interest to the readers of the publication, by its editors or writers who have been invited to make the contributions. There should be news items in which the medical profession may be expected to take an interest, particularly news pertaining to the activities of the profession. There should be other items of rather a miscellaneous character, that would be calculated to be of interest to the reader.

"Much of news, particularly that pertaining to the activities of local medical societies, would be out of place in a scientific medical journal, and particularly would propaganda material be inappropriate. Perhaps we have said enough to point to the difference between the purely scientific publication and the organization journal. The editorial management of a purely scientifical medical journal must be wise. The editorial management of a state journal should be wiser. They both are sometimes otherwise.

"The decision as to the proper length of an article which has been submitted for publication, or as to the number and character of illustrations to be allowed, is not always easy to make It is easy to delete repeated observations, or observations which are not in accord

with the main purpose of the article, but it is not so easy, for instance, to decide whether a statement is a needless repetition or a helpful reiteration. It is easy to decide to omit an illustration which does not illustrate, or will not show in the printed form what the author intended it should show, but frequently it is necessary to take several pictures to illustrate a single principle, or the nature of the contribution may be such that each of a number of cases should be illustrated to be made clear editor may find himself confronted with the necessity of omitting all illustrations, and perhaps the entire contribution. And it will be borne in mind that space in a printed publication costs money, and cuts cost much money For instance, the cuts in the August Journal cost \$7540, and those for September cost \$120 05 These prices do not include the cost All authors of the space the cuts occupied do not appreciate that a bad impression is made by unduly extending discussion, or padding with pointless illustrations The editor must protect the author and the reader as well in this regard

"We have often wondered whether we were justified in printing the minutes of our House of Delegates at such length Very few medical organizations do that, not only because it costs a lot of money, but because not many, unfortunately, are sufficiently interested to Many organizations believe that read it all it is better to make editorial comment, or a printed synopsis of proceedings, holding the complete verbatim report of the official stenographer for reference in case of dispute trustees have given the matter frequent and careful consideration, and have invariably come to the conclusion that they should at least make permanent record of the proceedings of our House of Delegates and place them before and in the possession of every member of the They hold that it is their busi organization ness to provide the water and then lead the horse to it, but not their business to compel the horse to drink of the water It is not their fault if the horse won't drink They have advised, however, that the synopsis, or editorial comment, be also provided, and that is invariably done, how wisely and how well, of course, we cannot say We have endeavored to determine the advisability of our custom in this regard by making inquiries among our members Some approve of the idea, and some do not think so much of it

(Continued on page 1385—adv xui)

(Continued from page 1382)

"We have been in the habit of making extended editorial reference to the transactions of the American Medical Association house of We have wondered whether we were justified in doing so, both from the standpoint of cost and effort. We believe that in doing this we have contributed materially to the cause just referred to, and that in this manner we may hope to keep our members acquainted with the proceedings of our national body about as nearly as that objective may be attained, under the circumstances We have a number of letters of commendation of this course, from which we will select a few, in justification of our custom

"Particularly we have wondered whether we should devote the space that we have been m the habit of giving to the publication of reports from our county and district societies It is our thought in this regard, that in printing these reports, in full, we are giving to our members information which at any time may be helpful, and we are preserving for posterity a picture, as it were, of the activities of the medical profession of our state at this particular time. As to the immediate usefulness of the information thus published, perhaps we cannot say much We do not know just how much good the abbreviated statements make about the discussions in our county societies will do those who read them, but we do know that here and there publication of the fact that certain subjects were discussed have brought parties together in different parts of the state, to the advantage of all concerned, including the dependent public We go to greater length in printing this sort of material, we think, than most of the other state journals We print all we can get. It is true that we edit this material very closely, and throw out much of it, but we try to preserve the essential parts We would like to have more of these reprots The society stands in its own light which does not see that we get them We will appreciate letters from our readers in regard to this and other matters we have discussed in this editorial

"We are not always informed as to the deaths in the profession When we learn of the death of a reputable member of the profession, we make strenuous efforts to secure data from which an obituary notice may be based, and we make special effort to secure photographs of the deceased It would surprise many of our readers to know how difficult it is to secure this material, even from the family of a deceased physician, or the secretary of his county medical society It would seem that we can do no less than to publish an illustrated obituary of those of our number

Ultra-Violet Combined With Heat and Light Make Possible a Wide Range of Therapeutic Uses

CLINICAL evidence and the experience of well-known authorities has shown that the new Battle Creek Super Solar Arc Lamp may be successfully used to treat a wide range of the most stubborn and deepseated disorders

Not only does this AD-VANCED-TYPE LAMP possess many improved mechanical features of construction, such as the automatic magnetic feed which prevents loss of time in waiting for the rays to attain adequate intensity, but the superiority of this lamp in the treatment of general constitutional conditions, as well as local surface conditions, is largely due to the combination of rays produced

An ample amount of ultraviolet radiation plus the radiation infra-red, results in the production of a spectrum that most closely approaches that of the sun Since the Super Solar Arccombinesultra-violet and infra-red rays it finds dozens of uses, for rachitic patients, for skin diseases, for relief of congestion, and other conditions The technic of handling this lamp is easily and quickly mastered

Our new bulletin describes fully the many mechanical and therapeutic advantages of the Super Solar Arc May we send you a copy?

Oscillo-Manipulator

This appliance, through years of development, has become a tested substitute for hand massage. It has proven of great value in practically all cases in which general or localized massage is indicated.

"Veelite" for Infra-red

This lamp radiates soft, penetrating rays of infra red. Unique features are the new V-shaped element and ease of adjustment.

Vibratory Chair

A therapeutic unit of proven value for the application of vibration in the treatment of disease The entire nerv ous and circulatory systems are reach ed by Vibratory Chair treatment.

Solar Arc Lamp R-40

A convenient, powerful and most efficient appliance for heat, light and ultra-violet therapy

PELLAGRA IN KENTUCKY

The Kentucky Medical Journal of October contains an editorial on a conference for the consideration of pellagra in Kentucky The article states

"Pellagra appears to be not only one of the most important causes of sickness and death in Bell County, but one of the most important causes of suffering and lack of physical well being, and one of the most important complicating factors of other diseases. We found that there were more than a thousand cases of this disease in Bell County. It was apparent from the investigation in Bell County that a similar situation confronted the profession in several adjoining counties.

"As a result of this investigation, Doctor Mc-Cormack and Doctor Blackerby were courteously requested by Doctor Ed Wilson, President of the Cumberland Valley Medical Society, to attend its recent session at Dishman Springs, and the entire morning was devoted to the discussion of this important problem. This conference was one of the best we have ever seen. Seventy-three of the progressive physicians of Southeastern Kentucky participated in its consideration.

"It was the consensus of opinion that pellagra has again assumed epidemic proportions in Southeastern Kentucky, that it develops chiefly in the undernourished, especially those victims of other wasting diseases It was recognized that, as a rule, pellagra does not develop in those having a broad diet of fresh meats, milk and the green vegetables, but it was also made evident that on account of the economic condition of money of the victims of this disease, it is practically impossible to expect them to secure such a preventive diet The researches of the scientific experience of the U S P H S have developed the important fact that in brewers yeast, which can be supplied at an average of 10c per week per person, we find such a large concentration of the pellagra preventive elements that this can be used as a substitute for the effective diet, which would not only prevent this disease but would add so much to the welfare and usefulness of these people The Journal is glad to call the attention of the profession of the State to the fact that this yeast is available at the price of 22c in two-pound packages and at 19c a pound when ordered wholesale.

"There was no consensus of opinion in regard to the medical treatment of the disease, beyond the recognized fact that the addition of yeast to whatever other form of treatment is indicated is essential in the undernourished cases. Many of the physicians present indicated that they would try various forms of therapy with careful controls with and without yeast, and we anticipate

CONSTIPATION

In the Breast-Fed Infant

HORLICK'S MALTED MILK has long been used with success in the prevention and correction of constipation among breast-fed infants

For the Nursing Mother-

Many doctors advise the nursing mother to drink regularly each day three glasses of Horlick's—the Original—Malted Milk knowing that she will add to her own store of energy, increase the flow of her breast milk and provide her child with the food elements which result in regular bowel movements daily

For the Breast-fed Baby-

Supplementary feedings of 'Horlick's' almost invariably bring relief to the child and rest to the mother, even in stubborn cases of constipation

(Continued from page 1385—adv xiii) who have well served the profession and its

public, as most of these have served them both
"We receive for review many books intended

for the library of the physician We endeavor to estimate these books for our readers, in order that they may know something about them before they spend their hard-earned money in their purchase. This service is not for the publisher. It is for the reader. It cannot be bought

"Lastly, our editorials are for the most part not editorials We have adopted the policy of discussing editorially, rather than in detached form, the propaganda necessary to the success of the organization We formerly undertook to print each month at least one editorial on a scientific subject, and practically all discussions in the editorial section were, in fact, by way of editorials, whether or not Obviously, an intricate and involved problem, such, for instance, as the machinations of quackery, in opposition to scientific medicine, and particularly legislation relative thereto, cannot be embraced in a few high-sounding phrases, however talented the editor may be We often wonder whether we should not revert to the original and classic standards of editorial writings It would suit us much better to do so, but we are rather apprehensive that our propaganda, which is necessary, and must be promulgated in print, would go unnoticed if printed in the miscel-laneous section of the Journal It takes words to express thought, and put it over Some of us cannot write very well any other way, and many of us don't understand any other sort of writing That is not a criticism It is an ob-There are two reasons why people do not comprehend well written articles First and foremost, it is a lack of brain power and training Second, and perhaps most usually, it is a lack of time and disposition to give Doctors are thought to the matter in hand necessarily educated men The conclusion is that the doctor does not comprehend because he does not take the time and go to the trouble Attractiveness and conciseto concentrate ness in writing will help there, but the great bulk of readers will not care to concentrate on the cryptic, correct diction of the high-class editorial writer

"There are other problems met with in compiling the various numbers of the Journal, too many for detailed reference here. We revert to our thought in the beginning of this discussion. Do we print too much, or too little, or material of the wrong sort or in the wrong combination, or what about it? We would, indeed, be appreciative of constructive criticism. We do not care for the other kind."

(Continued from page 1388-adv xvi)

county health department is the presentation of the entire plan and program to the local medical society. If approval is withheld by the societ, no further activity is engaged in relative to the development of the local health department The soundness of this plan is proven by the very sub-tantial growth and wide extension of fulltime county health work during the past five

DENUNCIATORY EDITORIALS

This political season demonstrates the u-clessness of violent denunciation interperation like the howling wails of a child, is evidence of vigorous strength that elicits amusement other than pity An example of amusing vituperation is afforded by a recent number of one of our exchanges which says

"Aside from the loathsome and penetrating odor of the American skunk, it is a very charming animal

"We found such a creature at a meeting, but it was not the neat little black and white animal of our boyhood days It appeared in

the form of a big man in avoirdupois but a skunk in disposition

"Invited to present a paper as an honored guest one of the speakers appeared and was given the attention he deserved reverted to type The air has ever since fairly recked with his evil smelling odor rushed to some inexperienced or palm itching son of the pen who broadcasted, through the Associated Press ideas he never dared express Apparently he was their in the meeting The Rocky Mountain region was flooded by his self praise. He made no new discoveries but tried to make an advertisement of his appearance on the program ethical conduct is its own condemnation'

The essence of humor is a seriousness out of proportion to the occasion. This writing has an air of humor which belongs to the smoking room of the medical club. If we were running a joke page, we would certainly put this abstract in it However, doctors on the Atlantic seaboard are more subtle, though hardly less efficient, in their methods of securing medical publicity

Malnutrition, Marasmus, Infantile Atrophy, Athrepsia

In an endeavor to improve conditions that may be properly grouped under the above-mentioned terms, the first thought of the attending physician is an immediate gain in weight, and the second thought is to so arrange the diet that this initial gain will be sustained and progressive gain be established Every few ounces gained means progress not only in the upward swing of the weight curve, but in digestive capacity in thus clearing the way for an increasing intake of food material As a starting point to carry out this entirely rational idea, the following formula is suggested.

Mellin's Food

8 level tablespoonfuls

Skimmed Milk

9 fluidounces

Water

15 ounces

This mixture furnishes over 56 grams of carbohydrates in a form readily assimilated and thus quickly available for creating and sustaining heat and energy The mixture supplies over 15 grams of proteins for depleted tissues and new growth, together with over 4 grams of inorganic elements which are necessary in all metabolic processes These food elements are to be increased in quantity and in amount of intake as rapidly as continued improvement is shown and ability to take additional nourishment is indicated Continued repetition of highly successful and oftentimes remarkable results from the application of this procedure justifies its universal recognition

A pamphlet devoted exclusively to this subject and a liberal supply of samples of Mellin's Food will be sent to physicians upon their request

Mellin's Food Company, 177 State Street, Boston, Mass.

(Continued from page 1387—adv xv) valuable contributions to the therapy of pellagra by the fine practitioners of this section"

PHYSICIANS AND PUBLIC HEALTH IN TENNESSEE

The October issue of the Tennessee State Medical Journal contains the following description of the physician in public health work by Dr E L Bishop, Nashville, State Commissioner of Health

"One of the greatest teachers of preventive medicine has said that the practicing physician is the most essential arm of preventive medicine

"It is the universal experience of the State Health Department that the partnership and cooperation of practicing physicians can be secured if problems are taken to the individual physicians and organizations concerned, frankly discussed and a course of procedure agreed upon. This method of managing problems that are to any extent controversial has proven universally successful and has become a basic element in our policy.

"In illustration of this policy, let me cite the activities of the newly established Division of Tuberculosis Control in our Department

"Before a clinic is established in any county, the whole plan of activity is discussed before the County Medical Society, or, where there is no medical society with a majority of the local physicians Care is taken to explain every step in the development, contact and follow-up of the diagnostic clinics The Medical Society is told that the State Health Department will not at tempt the development of a single clinic unless definite approval is given by the society instance has this approval been withheld. It is, I believe, a proper function of the public health worker to assist in finding early cases, since these cases would not consult a physician until after the disease was well advanced and presented obvious symptoms On the other hand, if case finding is to be of any value, the discovered cases must be placed under the active care of a physician, for discovery is useless unless treatment is The successful partnership program available in this instance is demonstrated by the fact that practically every case discovered in the diagnostic clinics has been successfully placed under the care of the family physician

"Another item in our policy will further illustrate our point of view. The Division of Local Organization of the State Health Department has charge of the development and coordination of full-time county health departments. The first step looking to the establishment of a full-time

(Continued on page 1389-adv xvii)

the profession needs the public. There must be co-operation. Heywood Broun tre columnist. has this to say about medicine: In the long run the heretics or reformers, call them what you will return to the hospitable arms of Mother Medicine Sometimes the vast majority of organized pracbuoners seem set and sealed against well derronstrated mnovation, but in the long run truth will prevail' If we, in our generation can leave the practice of medicine a little better, we will not have hved in vain. We should always realize that ours is a real profession and we can say that Descartes the French philosopher, was right when in the seventeenth century he said 'If ever the human race is raised to its highest practical level, intellectually morally and physically science of medicire will perform that service

RURAL DOCTORS IN ILLINOIS

The September issue of the Illinois Medical Journal points to the following letter by Dr Paul R. Howard, of Kankakee, regarding the reasons for the decline of rural medical service

"The article in the August issue of the lournal from the 'National Grange' relative to the country doctor situation is interesting but does not place the blame where it be-The farmer is to blame ceased to adequately support the country doctor and the basic reason for this is ease

of transportation

"I started practicing nearly thirty years ago in the horse and buggy age. In those days it ordinarily took two hours to go twelve miles Nowadays the farmer in that community can drive fifty miles in the same length of time and he does In that community today the local doctors get nothing but emergency cases and confinements and other work among people who are too poor to get away The confinements all go out of town, (if able) much of the surgery goes out without even consulting local men Whereas, the town used to support four or five doctors it is now able to support only two, and they are hard up The people are still there, the sickness is still there, but it is on wheels travelling to the

hig towns
"The farmer has deserted the small town and doctor, not the doctor the small town and

the farmer

It is not specialization except in this respect that the farmer will get into his car and go to a specialist himself without even consulting the home doctor, and an awful lot of them do"

WORK FOR COUNTY MEDICAL SOCIETIES

The Journal of the Oklahoma State Medi Association of September makes the follows editorial comments on the field of work of t County Medical Society

"This is the beginning of the open season county medical societies, or it should wherever even the smallest congregation

physicians can be gotten together

"Rural physicians especially have been i usually busy, and will be for some time, cari for the additional load imposed by a wi existence of malarial infection There are new roads for the control of this infection. its control and eradication should prove great interest to physicians and benefit to t Thousands of Oklahoma children a public now entering the public schools, and this ve massing will produce a sharp rise in the d eases incident to children These diseases a accompanied by mildness, severe illness at considerable fatality to life Some of them a preventable, others fairly easily controlled at treated, while some are very difficult of co All of these problems are subject variations and exceptions as to behavior When physicians meet and discuss them, r lating their failures and successes, their ba flements, and how they met them, then ever one present has an insight to the other fe low's problems, and it is a dull man, indec who may not either reap some benefit or pasome along to his fellow practitioner

"County society officers should at once pla for prompt meetings and reorganization order to reap benefits from the time an

occasion'

COMMUNITY MEDICINE

Dr Norman M MacLeod, of Newport, Pres dent of the Rhode Island Medical Society, di cussed Community Medicine as follows in h annual address before the Society on June 7, 192 as reported in the Rhode Island Medical Journa of October —Editor's note

"Community medicine means to many phy sicians that the public is usurping the function of the profession in educating and caring for the There are some persons and som agencies that are too enthusiastic, and would we come the advent of real state medicine, but th rank and file of the public still have faith in th Real progress is the result of in profession dividual investigation, and state medicine would tend to lessen individual activity

"The community needs the physician in further ing the ideals of preventive medicine, and surely

December 1, 1928

THE MANAGEMENT OF DROPSIES

By WM S McCANN, MD, ROCHESTER, N Y

From the Department of Medicine of the School of Medicine and Dentistry University of Rochester, Rochester, N 1 and the Medical Clinic of the Strong Memorial Hospital

ROM a purely clinical standpoint a rough classification can be made of oedemas

I Circulatory or Mechanical oedemas

II The so-called Renal oedemas Oedemas associated with renal abnormalities

III Nutritional oedemas

IV Oedemas associated with thyroid deficiency

V Localized oedemas due to vasomotor and neurotrophic disturbances

In any given case it may be difficult to decide
what factors are operating to produce the dropsy
For instance a patient with a chronic nephritis
may have oedema from renal insufficiency, or
from heart failure secondary to the hypertension,
or both factors may be operating. Again, this
patient may have been a long time under a dietary
regime which restricted the protein intake until
a true hunger oedema was added to his other difficulties

In severe myxoedema the hydrophilic tendencies of the body are well known, yet when true dropsy is added to myxoedema it may be of cardiac origin, owing to the arteriosclerosis and anemia which so often develops in the course of myxoedema

The pure nutritional oedemas, occurring without evidence of obvious cardiac or renal insufficiency are rare at present in prosperous and peaceful America, yet only 10 years ago they were common enough in the Central Empires suffering from a "hunger blockade" (1) They are still occasionally seen here as the result of perverted appetite, abnormal dietary fads of cranks, and sometimes because of excessive reduction of protein intake by a physician's orders. The writer has a strong personal conviction that the latter cause operates to produce oedema in many cases of chronic nephritis, sometimes alone, and sometimes in combination with other factors.

*Read at the Annual Meeting of the Medical Society of the State of New York at Albany N Y May 23 1928

In beri-beri and epidemic dropsy (2) we have somewhat different variants of the simple hunger oedema due to insufficiency of protein in the diet

In complicated cases some light is thrown upon the mechanisms involved by the responses to therapy. The general measures available are as follows

- (1) Salt restriction is fundamental in all The accumulation of oedema fluid is oedemas accompanied by a retention of sodium. In general water follows sodium. It is the sodium ion of the salt which is important, not the chlorine Salt restriction aids to prevent massive accumulation of fluid in heart failure, as well as in renal disease. One can produce wide fluctuations in the weight curves of my oedematous patients by being alternately liberal and sparing of salt in the diet In hunger oedema there may be polydypsia and polyuria with retention of chlorides, which will be increased by liberal salt intake but only slightly reduced by salt restriction Even in serum disease there is a disturbance of salt excretion
- (2) Digitalis In chronic nephritis with oedema one may be in doubt as to the extent to which cardiac failure enters in until after the use of digitalis in full therapeutic doses

Residual oedema in patients with severely damaged hearts is frequently observed, even when the kidney function seems to be good and after exhibition of digitalis in optimal quantities. The measures to be resorted to for the reduction of residual oedemas of this kind will be discussed below under diuretics. Digitalis is the most important diuretic, as the majority of dropsies are of circulatory origin. The writer has on record a loss of 120 lbs of body weight as the result of use of digitalis and salt restriction.

(3) Directics other than digitalis The safest of these is water itself In many cases of dropsy, not of circulatory origin, the oedema may be protective to some extent Especially is this true in acute and subacute nephritis Christian, some

COUNTERIRRITATION

Counterirritation is a term applied to the use of substances irritating to the surface with which they come into contact and is widely employed for the purpose of influencing morbid processes in more or less distant parts or of affecting the general system According to Hare ("Practical Therapeutics," 1927) counterirritation is in reality based on sound physiological laws, resting as it does upon reflex action, or the conduction of a nervous impulse to a center, which, when so stimulated, sends out an impulse to that part of the body which is diseased Physicians the world over have long considered antiphlogistine as the logical counterirritant, first, because of its marked decongestive action in cases of inflammation and congestion, second, because of its efficacy in causing the absorption or removal of inflammatory deposits after true inflammation has ceased, and, third, because of its distinct analgesic and thermopenetrative properties -See advertisement, page in

the same patient, who had arteriosclerotic heart disease with congestive failure

In Figure 1 is shown a marked decrease in weight of the patient due to the action of potassum citrate during the period in which digitalis was accumulating. This chart shows also very clearly that over-digitalization decreases the efficiency of the circulation with a diminution in vital capacity and increase in body weight, when the optimal dose, calculated by Eggleston's method, had been exceeded

In Figure 2 it will be seen that the patient, under the influence of toxic amounts of digitalis, had again increased considerably in weight. A diuresis was obtained by the use of 21 gm potassium citrate daily. Digitalis was being lost from the body during this time. As the amount fell below the optimal level of digitalization the amount of potassium citrate was decreased and the weight rose, to fall again when the larger doses of potassium citrate were resumed. When the urea was substituted for potassium citrate (20 gm daily) the weight rose, to fall again when potassium citrate was resumed.

That the diuretic effect is due to the potassium ion, and not the citrate ion, is shown in Figure 3. The weight is seen to remain nearly constant while sodium citrate was being given, followed by a decrease in weight starting immediately the potassium salt was used.

Calcium salts have been used both in oedema with heart failure and with nephritis wnter's experience with it has been most favorable in the latter group of cases There is at precent under treatment a case of chronic nephnts with a persistent oedema which had resisted all treatment including digitalization, severe salt restriction, parathormone, calomel, ammonium chloride and novasurol, and several tappings for hydrothorax When calcium nitrate was given in doses up to 30 gm per diem a diuresis ensued in which the salt excretion rose and the weight fell for the first time in many weeks A graphic chart of this case is not yet available Massive albuminuna and hematuria, low serum calcium, low total protein of the serum, with a decrease in the alglobulin ration, were observed in this patient

Severe toxic symptoms appeared after the patient had received about 200 gm of calcium nitrate in 8 days. The pulse became rapid, weak and small. The blood pressure fell. There was rapid shallow breathing, marked asthenia and a blue-green cyanosis. The latter was probably due to formation of nitrous oxide—themoglobin, as it was not marked in those cases developing the other toxic symptoms while under treatment with calcium chloride.

Such toxic phenomena have been observed three times. They are most alarming when they occur So far no deaths have occurred from this cause. They may be relieved by the administration of

sodium as bicarbonate, by mouth, in doses of 5 grams repeated at 2 hour intervals, or without this they may wear off in the course of 36-48 hours if calcium is discontinued

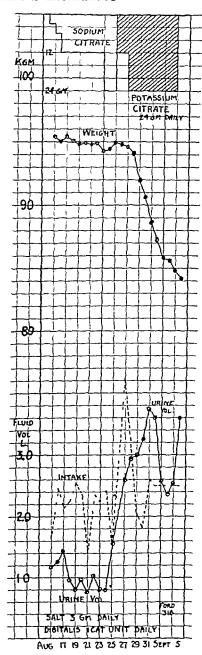

FIGURE 3

Contrasting Action of Sodium Citrate and Potassium Citrate on Weight Curve Same patient as in Figures

1 and 2

So far no toxic effects of the potassium ion on the heart have been observed, though in one case the development of anginal attacks may have had some relation to it

Novasurol and other diuretics dependent upon the action of mercury or bismuth are frequently years ago, showed how dangerous were those duretics which act upon the kidney itself, such as purin diuretics, theobromine, caffeine, etc. On the other hand, in such cases, water may be tried safely provided one desists in time in case diuresis does not ensue. The water, of course, must be given without salt.

We have the record of a diuresis induced by water in a patient with acute nephritis. Salt was carefully excluded and the water ingestion was increased. An almost complete suppression of urine was replaced by a diuresis in which large quantities of nitrogenous matter were washed out of the body. The amelioration of toxic phenomena was great. The diuresis did not carry out an increased amount of sodium chloride, in fact, the oedema increased a little, but vomiting and twitching ceased and the nonprotein nitrogen in the blood decreased.

Parathyroid Extract was given to this same

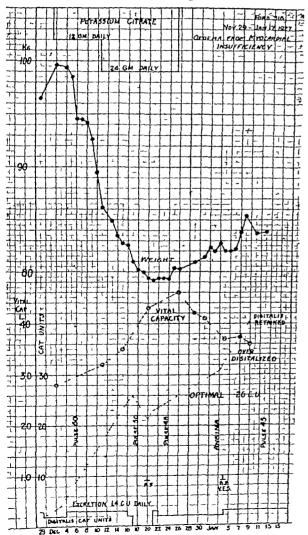

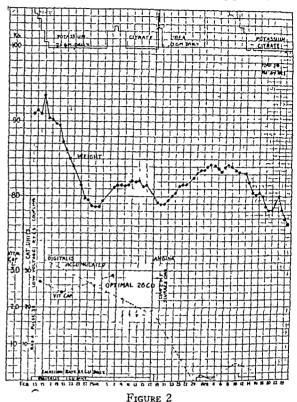

FIGURE 1

Effect of Potassium Citrate and Digitalis on Weight

Curve in Heart Failure

patient in a small dose of 10 units. A diuresis ensued with a great outpouring of salt and water with a resultant drop in weight.

A similar diuresis was related to the administration of parathyroid extract in a second case. The weight had previously been dropping at a steady rate due to salt restriction. Following parathyroid

Effect of Potassum Citrate and Urea on Weight Curve in Heart Failure Same patient as in Figure 1

extract there was a distinct acceleration of weight loss due to diuresis with an increased excretion of chlorides

These two cases were reported by the writer (4) with a third case, together with somewhat similar experiences of Davidson, Mason, and Meakins Since then the writer has tried it without success in three other cases of obstinate dropsy with nephritis. It may be that the parathyroid hormone is capable merely of accelerating a duresis which has been initiated by other means, without being able to initiate it. In a fourth case the patient had an intractable diarrhea induced by parathormone on two occasions. The blood calcium was decreased. No diuresis occurred, but weight was lost as a result of the diarrhea. Until its action is better understood the parathyroid extract will probably have a very limited usefulness.

Potassium salts have proved to be of great value in our hands in the management of residual oedema in cardiac patients. The three charts which follow represent repeated observations of

ets and tetany This is a sterol extracted from yeast and has a potency far exceeding that of any other anti-ricketic agent. We gave this preparation by mouth as has been done by others. In a few instances, owing to repeated convulsive seizures, we thought it necessary to give irradiated ergosterol intravenously. This measure resulted in prompt allaying of the convulsions and brought about no unfavorable clinical manifestations.

Case 1 W G, 5 months old, colored, was admitted in April, 1928 Since the age of 6 weeks he had been having several generalized convulsions a day. He had been nursed for one month, following which cow's milk, farina and orange juice had been fed. He had received no Cod Liver Oil

He showed ricketic rosaries, a big head, pot belli, umbilical hernia, laryngospasm, and carpopedal spasm. Blood serum calcium 5.2 mg per 100 c c., inorganic phosphorus 6.9 mg per 100 c c X-ray of the long bones showed cupping

The following table is quite interesting

V ^E LI Dae	ग्राप्ट	Calcium per 100 c.c.	Phosph mg per		Irradiated c. Ergosterol	Remarks
•	26 27	5.2	69	10 mg	intravenous	6 convulsions 2 convulsions No convulsions
N'ay	11	10 6 10 8	7 0 8.4	10 mg	intravenous	Ne convulsions Laryngospasm
4 4	18 25 26	9 9 10 8	6 4 7 0	10 mg	by mouth	absent Resting quietly Resting quietly Resting quietly

Comment Active manifestations of tetany associated with rickets in a colored infant, admitted in the spring almost exclusively bottle fed (cow's milk) The administration of irradiated

ergosterol was followed by marked improvement Case 2 L. C, admitted May, 1928, was 6 months old and white He had had 10 convulsions in the day prior to admission. He had been fed cow's milk exclusively since birth and had also received orange juice and cereal but no Cod Liver Oil. The day after admission, the baby had 5 generalized convulsions with loss of con-

Date	ng	Calcium		rganie phorus Irraduated	
May	22	Let. 100 C C II	g per	phorus Irradiated r 100 c c. Ergosterol	Remarks
	23			~	10 convulsions
-	22 23 24 25	69			6 convulsions
	25		5 1	10 mg intravenous	5 convulsions
T	26	_	-	∢	2 convulsions
June	I	10 4	58		No convulsions
4	2			10	Restless
4	5			10 mg by mouth	No convulsions
4	-	_		10 mg by mouth	No convulsions
*	8	10 6	43	a by mouth	Resting quietly
44	-			10 1	Chvostek absent
	12			10 mg by mouth	No consalmons
ч	15			75 mg by mouth	[Carpopedal
4	19	115	64	10 mg by mouth) Spasm absent
	-,		-	10 mg by mouth	Resting quietly
				we of mouth	Resting quietly

sciousness, spasm of face, and tonic and clonic contractions of the extremities. The next day there were two similar convulsions

The infant showed a red and injected nasal and pharyngeal mucosa, temperature of 101° F, enlarged emphysis, Chvostek's facial phenomenon and carpopedal spasms. The blood serum calcium was 69 mg per 100 c c and inorganic phosphorus 51 mg per 100 c c respectively

The effects of irradiated ergosterol can be seen

in the chart

Comment Manifest tetany probably precipitated by an upper respiratory infection, during the spring in a child ted cow's milk. The administration of irradiated ergosterol effected a rapid cure.

Case 3 E B, a colored infant of 6 months, was admitted in May 1928. He had been fed condensed milk and orange juice but no Cod Liver Oil. His head perspired freely. He had a large head (45 cm.), ricketic rosaries, anterior fontanel (5½ x 5 cm.), a distended abdomen and bowing of both tibiae (antro-posterior and lateral). X-ray of the long bones showed the fuzzy ends. Blood serum calcium, 74 mg per 100 cc., inorganic phosphorus, 55 mg per 100 cc. He was observed for a month, with the following results.

Drte	mg	Calcium per 100 c c. n	Phos	rganic phorus Irradiated r 100 c c. Ergosterol	Remarks
May	16 23	7 4 6 4	5 5 5 8	2 mg intravenous 5 mg intravenous	Restless Restless
June	25	8 3 8 4	58	_	Resting quietly Resting quietly Resting quietly
"	8	90	5 8	10 mg by mouth 10 mg by mouth	Resting quietly Resting quietly

X-ray of the long bones showed decided improvement, with a definite line of calcification

Comment A case of latent tetany which showed improvement clinically, in the serum calcium content, and in the bones, following irradiated ergosterol medication

Conclusion

The administration of irradiated ergosterol markedly increased the blood serum calcium in a few days

Furthermore, it promptly stopped the convulsions in infants who were in a tetanoid state Irradiated ergosterol was given intravenously in this type of case, although we do not advise this route of medication. It may be better to resort to this method in cases of tetany which do not yield rapidly to the usual measures and when life may be threatened.

belief that in many cases of chronic nephritis the dropsy may be partly due to manition as a result of over-zealous restriction of protein intake by Such cases may improve greatly on physicians a more liberal ration of protein b

Conclusion

- 1 The basis of management of all dropsies is restriction of salt intake
- 2 The circulatory factor in an extensive dropsical state is best determined by the response to full physiological doses of digitalis
- 3 Residual oedema after digitalization, in cases of circulatory origin, is often relieved by doses of potassium citrate of 20-24 gm daily
- 4 In oedemas associated with nephritis with hematuria water is the safest diuretic. A water diuresis may often be obtained provided the diet is salt free A water diuresis, if obtained, is valuable in relieving the intoxication of renal insufficiency
- 5 Calcium salts may be tried in obstinate cases of dropsy with renal disease in the chronic stages Definite calcium intoxication has been observed in 3 cases, with weak rapid pulse, low blood pressure and asthenia The antidote is sodium.
- 6 Further trials of parathyroid extract have been disappointing The evidence indicates that it will sometimes accelerate a diuresis already started
- 7 Underlying some cases of obstinate dropsy there may be a thyroid insufficiency, and one must also remember that long continued protein starvation may be a contributing factor. In dropsy with nephritis, as well as with nephrosis, a liberal protein ration may be very beneficial, if protein intake has been previously restricted to an extreme degree

IRRADIATED ERGOSTEROL IN THE TREATMENT OF TETANY By MORRIS GLEICH, M D , AND SAMUEL GOODMAN, M D , NEW YORK, N Y

From the Pediatric Department of Harlem Hospital, New York City

F we concede that a diminution in the serum calcium salts is the primary cause of tetany, medication which raises the calcium content of the serum should be the all-important factor in the prevention and treatment of this nervous symptom-complex

Hess and Windaus suggest the use of irradiated ergosterol for the treatment of infantile rick-

of gas, especially after eating, more or less neuralgic pains throughout the body Careful examination revealed parenchymatous nephritis, casts with degenerated epithelium attached, large amount of albumin She had been ailing for a year or more and was pregnant two months Basham's Mixture with a regulated diet was ordered. In about two weeks she was feeling fairly well, very little albumin, indican only slightly increased, casts were far less in number but sufficiently present to show Bright's Disease still existed

This young woman had two perfectly healthy children, both born some time previous to 1918 She was cautioned to call her doctor with any appearance of nervous symptoms, continued on a moderately restricted diet and Basham's Mixture, to be used at least for a week out of each remaining month before delivery

I did not see her again for about three years when she consulted me, not only for herself, but the little boy It was evident that he was suffering from a marked degenerative condition - ears, head and chest abnormally large, asthma was marked

We know, as physicians, that a person weighing 150 pounds should have present 25 pounds of carbon, 7 pounds of lime, 11/8 pounds of phosphorus, 1/4 ounce of iron and other chemical ingredients in proportion We further realize that these come from the food taken by mouth and that they must be present in as near a normal amount at all times as it is possible to have them

Resisting power is furnished the human being through the nervous system Phosphorus is the nutrition of the nerve cells, and to a great extent, the same applies to the bones

Going back to the animal kingdom, it is found that both father and mother, but especially the latter while in colt bearing season, not only receive the most careful attention, but are fed accordingly

How is it with the human being especially the mothers of today? Their bodies are deprived of nutriment by underfeeding so they will not become fat, tobacco is used, the snioke being inhaled, resulting in the absorption of nicotine which acts most deleteriously on the nerve cells, but above all, and probably the most important, "the candle is burned at both ends" by the candle is burned at both ends" by turning day into night, with parties, the A machine of any kind, is rested during the 24 hours This, to avoid deterioration in the component parts The human body, and especially the brain cells, demand the same treatment, otherwise sooner or later trouble the sarely ensue - not always of necessity in the adult, but the offspring that is merely a

Rickets is a commonly observed word today,

and especially in the literature of commercial houses dealing in cod liver oil. In a few words, rickets involves all tissues, especially the bones in which softening occurs with deformities Many opinions are expressed as to the cause –hereditary syphilis, climate, etc – but we know one thing positively the condition is due to perverted nutrition, the chemical substances are not furnished the system in sufficient quantities Many claim, and the claim is well substantiated, rickets in a great measure is due to an absence of certain rays (ultra violet) supplied by the sun, plus what is known as vitamines These have been classified from A to D, but lately E has been added Who can tell when the alphabet will become exhausted? If we accept the theory of evolution—that the human being sprang from one cell and that cell was vegetable in nature, that it was sunlight that made it grow and flourish in the dim dark past, has not the same sunlight a similar effect on the human cell of today?

To prove the great value of sunlight one has to but cover a plant Even the grass covered for 36 to 48 hours commences to turn vellow Yet with all this evidence, we see young couples housing themselves up in apartments where a ray of sunshine never enters They have no verandas, no yards and when baby is born not a particle of sun reaches it except possibly a few hours that it may be taken out in a carriage or car If malnutrition has not already started, it soon does after baby is born

What we, as physicians, can do is a question for debate Women, as already alluded to, are the chief constructionists for nine months, many for the first two years Women are the ones to nhom attention must be directed

Two methods seem to be of avail to us one, psychical impression, the other, physical Woman is a bud of Eve Eve was noted for her vanity and susceptibility to suggestion Thus we find that we have a hard subject to work from a physical standpoint women must be given to understand that 10% of all babies born of smoking mothers die before the second year, that same thing is one of the most important causes of high blood pressure (the nicotine irritates the vaso motor centers, causing contraction of the vessels), that depriving themselves of sufficient nourishment so as to remain thin, jeopardizes the lives of their coming child, that rest, especially sleep, is conducive to resisting power in the unborn baby and that sunshine, not only for herself while carrying the baby, but later in life, is of the utmost importance.

From a physical standpoint, from the moment of conception and until the child is born, the mother should be looked after carefully as to those chemical elements that go to make

THE COMING GENERATION*

By J HENRY DOWD, M D, BUFFALO, N Y

"Care for baby's teeth before baby is born," said Dr W W Montgomery, a celebrated dental authority, at a meeting of their association some time ago

This is one of the most intelligent statements ever made, but in the opinion of the writer, it should not only refer to babies' teeth,

but babies' bodies

The day has not yet arrived when the human being gets the same attention as the dumb brute, it is a question whether it ever will, for affinity, known as love, has always been blind and probably always will be

That the breeder, and especially if he is working along scientific lines—hypotheses that can be proven by facts—wants a race horse, a draft animal, a hunter, white, black or bay, he can produce just such an animal In fact one celebrated breeding establishment has sold their progeny six months before they were born with a guarantee as to speed They were rewarded in fully 95% of the cases The explanation is simple, they knew the ancestors back to the third and fourth generation

That the same condition could be produced in the human family, there is not a question of doubt, but here enters "love at first sight," marriage without a question of ancestors and followed with a hit and miss progeny

Of one thing we are very sure a child is but an ancestral bud and this new born child, of which all believe, commences to live only after it has breathed oxygen from the outside air, has in reality been living for centuries, yes, ever since the day of Adam and Eve

But that is a question that need not necessarily be considered here for the life that it has lived as a paternal cell is confined to that great biologic force, the soul Let us consider the child from a physical standpoint

Not only must the father and mother be taken into consideration, but, as Henry Ward Beecher once said, "back as far as the third and fourth generation"

Whether the offspring be male or female, for the first nine months after conception, the mother is in absolute control, in fact for the first five years she is sole critic, dietician and guide

Man is a construction job There is no more difference between the builder that constructs and equips his factory with defective material than there is with the mother that supplies poor nutrition for her child, both will suffer

That mothers are furnishing defective nutri-

*Read at the meeting of the 8th District Branch of the Medical Society of the State of New York, at Buffalo, N Y, Oct. 2, 1928

tion today, there is not a question of doubt. Cod liver oil, the second day after birth, and continued as a regular diet for four or five years, mastoiditis becoming almost as common as measles, and the various other conditions with which we come in contact daily, seem to portray but one thing a generation of children coming into the world with very little resisting power. They are built on defective, porous foundations.

The following case, and it is only a sample of what all physicians are meeting today, bears out most conclusively the writer's opinion

T, age 10, seen in consultation at the Buffalo City Hospital This little boy had never been what can be called well and robust, always subject to colds and pains and aches of different character Some weeks before seeing him, he was suddenly taken ill, pains in the side, temperature ranging from 101 to 104, rapid pulse but no chills. On seeing him at the hospital, the temp was 103, pulse 98, severe abdominal pain Examination showed a very large liver and spleen, mitral murmur, very large ears and head, abnormally large chest with rosary, in fact, he was in a most pitiable condition. He had been in the hospital for three weeks and although at that time the red cells were 4,200,000, on entering the hospital they were 2,000,000, the whites 30,165 From the attached history, practically every one of the 26 billion cells had been examined, but only a tentative diagnosis of Splenic leukemia or anemia, had been suggested

The father and mother of the boy were healthy, robust people. He had two older brothers who had always been perfectly well and attended school every day

The boy was born during the influenza epidemic of 1908. His mother contracted that disease and nursed the baby at all times, extending over months in which the trouble hung to her. The baby had no artificial food

The writer prescribed Basham's Mixture for the little boy In about two or three weeks he was able to go home. Three weeks later a careful examination showed the blood to be in an almost normal condition as to cells and hemoglobin, indican and temp normal, as was the phosphatic index His liver and spleen, however, remained very large He had reentered school

The present condition may be simply a remission. He is far from normal and in all probabilities his state is due to defective nutrition during the first year or more of life.

Case 2 Mrs B consulted the writer as she was not feeling well—headaches, large amount

HEALTH CONDITIONS IN THE SOVIET UNION

By J V DePORTE, Ph D, ALBANY, N Y

Director, Division of Vital Statistics New York State Department of Health

HEALTH is an essential element in the life of any human group. Individuals may and have reached the heights of achievement even with a handicap of indifferent or poor health, but no social unit can function normally and preserve and develop its cultural and material treasure unless a sufficiently large proportion of its members possess the basic factor of physical health. The significance of any changes in the political or economic structure of a social group is directly related to the biological permanency of that group.

The Soviet experiment of planning the life of a great nation along theoretically developed, but hitherto untried, lines of personal and community conduct has for the last ten years fived the attention of the entire world upon the Moscow domains In the early period of the new regime stories of the Russian civil war, of the Red and White terror, the activities of the Cheka formed the bulk of news despatches originating within, but mainly from without, the country In recent years, with the stabilization of the Communistic government, other phases of Russian life took pre-eminence The state of agriculture, the growth of industrial activities, local and international trade, literature, the spoken and silent drama, represent now the bulk of published accounts of Russia In regard to one important aspect, however, the public health, we still know little It may, therefore, be worth while to summarize the latest official facts available on this subject

The Union of Soviet Socialist Republics extends over a territory of 8,504,093 square miles as compared with 8,764,586 square miles before the World War * The restoration of Poland, the formation of the Baltic States, the loss of Bessarabia, and the readjustment in the boundaries of the Caucasus resulted in a loss of 260,493 square miles, or 3 per cent of the old territory, inhabited by 24,689,600 persons The population of the Union, according to the census of 1926, was 145,806,624 In 1914 the number of persons within the present territorial limits was 135,599,015. Thus, the terrific losses caused by the World War, by the civil war, by epidemics and famine were more than offset by the natural increase in popula-About one-sixth of the population (25,-760,879) lived in cities The two capitals had a population in excess of a million Moscow (2019,453) and Leningrad (1,616,118)

in size was Kiev, with 593,873 There were altogether eighty-five cities over 50,000, of these, thirty-one were over 100,000 Women outnumbered men by more than five million. In the entire territory there were 928 men per 100 women, in the urban part the ratio was 932, in the rural, 927 men to 100 women.

VITAL STATISTICS FOR 1925

We present below a table of the birth and death rates and the rates of natural increase of the population in the three most important administrative units of the Soviet Union and for comparison, similar figures for the Registration Area of the United States and for the State of New York

		Віктн	RATE DEATH NATU	
I 17700	Population*	RATE	RATE INCRE	ASE
Russian Socialist Federated Soviet Republic	99,593,212	47 0	25 9 21	1
White Russian Socialist Soviet Republic	4,895,450	41 0	18 6 22	4
Ukrainian Socialist Soviet Republic	28,713,678	31 5	13 8 17	7
Burth Registration Area in Continental United States State of New York	87,636,000 11,172,913	21 4 21 9	11 8 9 12 2 9	

^{*}Estimated as of July 1, 1925

†The Birth Registration Area consists of states whose registration of births is 90 per cent or over complete. In 1925 it included thirty-three states.

Thus, in the Russian Socialist Federated Soviet Republic both the birth and death rates were more than double the corresponding figures in the U S Birth Registration Area death rate as high as that recorded in the former territory is unknown in this country or in the State of New York The most unfavorable rate ever registered in this State (214) was that of 1890 In the last quarter of a century the highest rate (188) was registered in 1918, during the influenza epidemic. The highest birth rate recorded in the State of New York was 246 in 1914-practically half of the rate in the R S F S R. in 1925 Even with a tremendously high death rate, the birth rate of the Soviet Republic was so high that the natural increase in population, 1 e, the difference between the birth and death rates was greater than the birth rate of either the Registration Area or of this State

INFANT MORTALITY

Figures are available showing the deaths of infants under one year of age in the three main soviet republics and in their urban and rural subdivisions. The following table presents the rates of infant mortality, 1 e, the number of deaths of

^{*}Figures relating to the Soviet Union are taken from its official Statistical Reference Book, 1927 published by the Central Statistical Department of the U S S R Figures for the city of lithed by the Moscow are taken from the Monthly Statistical Bulletin, published by the Moscow Soviet

bone, blood and tissue As to those already mentioned, iron, phosphorus and lime are as necessary as fresh air, water and sunlight. The mother furnishes these while the child is in utero. If she shows an abnormality, the child will suffer accordingly. The laboratory is a most valuable assistant but for those that cannot avail themselves of such, the writer would submit the following as most efficacious methods which may be carried out in a very few minutes by any general practitioner.

Speaking from a fundamental standpoint, the fact must not be lost sight of that it is the nervous system that is behind digestion, assimilation and metabolism, that this system has a specific nutrition that should be present at all times in a normal amount, and used the same But phosphorus, which is their nutrition, does not stop with the nerve cells—it is a component part of every cell of the human body Cod liver oil for vitamin D, or sunlight as it may be looked upon, may be true, but more truth is in the fact that the active principle of cod liver oil is phosphorus. May this element not be the vitamin of sunlight?

Ascertaining the condition of the nerve cells as to nutrition, is analogous to a red cell count with an estimation of hemoglobin for the blood, fully as easy to ascertain, if not more so

In making the phosphatic index, use the second urme passed in the morning, preferably about 10 o'clock

Fill the Phosphatometer with urine to U, add solution* to S, shake thoroughly and set aside for ten minutes. If at this time the precipitate is below NP, or light and fluffy and does not fall, nerve cell nutrition is below normal and must be supplied artificially. When the precipitate is above NP, the neurones are in a state of excitement and sedatives must be given lest the reserve become depleted, which is always followed by the condition known as neurasthenia.

Albumin in the urine shows anemia, when Bright's Disease, urinary inflammation (gonorrhea, cystitis, pyelitis or abscess of the kidneys) and certain heart involvements

Eliminating these conditions, if the phosphatic index is normal, give iron, if it is below normal, nerve cell nutrition phosphorus

Indican shows intestinal fermentation, when it is present in excess, digestion and assimilation are interfered with. With a practically normal index and the blood in the same condition, a bowel movement every day with 5 grains of sodium salicylate, will quickly correct the condition. If the index is low, or ane-

mia present, these must receive attention at the same time

In reporting the following cases, the writer does not wish to infer that these young mothers would have developed high blood pressure, eclampsia or other distressing symptoms, nor would the babies have been rickety, but both young women produced offsprings free from any taint whatsoever and have been exceptionally well since birth

Mrs J P, Age 27, backache, marked fatigue, leucorrhea, neuralgic pains in legs, pregnant about six weeks Careful examination showed no pathological conditions, blood pressure normal, urine, gravity 1010, no albumin, casts, crystals or pus, lots of vulvar epithelium, indican greatly increased, Phos Index 80% minus, crystals showed a want of nutrition Phos Comp, 20 drops with 15 drops of Fl Ex Valerian was ordered to be taken in milk 20 minutes after meals. In the course of two weeks all symptoms had disappeared and she felt fine, Phos Index showed 15% minus, crystals normal This prescription was continued for about three weeks and again during the seventh month

This young woman had a normal delivery, her milk was abundant, she nursed the baby until weaned. The baby, which is now four years old, walked very early, has never had a day's illness and never has taken a dose of cod liver oil.

Case 2, shows even more evience what can te produced This young woman was in a most miserable condition and suffered greatly during the first few weeks of pregnancy Because of social and other frivolities, she was in a very low condition of health, weighed but 119 pounds No pathological condition was evident but the urine showed a large amount of albumin, was opaque from epithelium, indican much in excess, the index was 95% below nor-The same prescription was used This young woman, who at delivery, weighed 178 pounds, was attended by Dr Irving Potter, who brought a baby girl weighing 91/2 pounds Mother had an overabundance of milk the second day, made a rapid and uninterrupted recovery At eight months, the baby had 6 teeth, weighed 20 pounds. In two years she has never been sick except with a cold for a couple of days no cod liver oil was necessary

In conclusion, it may be stated People always bring troubles upon themselves. We, as physicians, must try and convince parents, especially those with marriageable daughters, that aping a leader who is generally some female looking for sensation and glory, is simply following the dictates of a disordered mind. It will surely bring grief and their offspring ill health and resentment later in life.

State of New York	11,172,913	21 9	12 2	9 7

^{*}Estimated as of July 1, 1925

†The Birth Registration Area consists of states whose registration of births is 90 per cent or over complete. In 1925 it included thirty-three states.

Thus, in the Russian Socialist Federated Soviet Republic both the birth and death rates were more than double the corresponding figures in the U S Birth Registration Area death rate as high as that recorded in the former territory is unknown in this country or in the State of New York The most unfavorable rate ever registered in this State (214) was that of 1890 In the last quarter of a century the highest rate (188) was registered in 1918, during the influenza epidemic The highest birth rate recorded in the State of New York was 246 in 1914—practically half of the rate in the R S F S R. in 1925 Even with a tremendously high death rate, the birth rate of the Soviet Republic was so high that the natural increase in population, 1 e, the difference between the birth and death rates was greater than the birth rate of either the Registration Area or of this State

INFANT MORTALITY

Figures are available showing the deaths of infants under one year of age in the three main soviet republics and in their urban and rural subdivisions. The following table presents the rates of infant mortality, 1 e, the number of deaths of

^{*} Figures relating to the Soviet Union are taken from its official Statistical Reference Book,' 1927 published by the Central Statistical Department of the U S S R Figures for the city of Woscow are taken from the Monthly Statistical Bulletin published by the Woscow Soviet

infants under one year per 1,000 living births We are adding, for comparison, the total infant mortality rates and the rates in the urban and rural areas of the U S Birth Registration Area and of the State of New York in the same year, 1925

RSFSR	213
Urban*	174
Rural*	218
White Russian SSR	125
Urban*	110
Rural* .	128
Ukrainian S S R	146
Urban*	121
Rural*	148
US Birth Registration Area	72
Urban†	73
Rural†	<i>7</i> 0
New York State	68
Urban†	68
Rural†	66

^{*}Urban includes all cities, rural the rest of the territory t Urban includes municipalities which had, in 1920, a population of 10,000 and over Rural designates the rest of the territory

Thus, in the RSFSR, one out of five children born alive died during the first year. The mortality was more favorable in White Russia and the Ukraine. In all three divisions rural mortality was higher than urban, while in the US Birth Registration Area and in the State of New York the contrary was true.

The highest rate of infant mortality ever recorded in the State of New York since the time when the registration of births became sufficiently complete for statistical purposes (1914) was 99 in that year. The highest rate recorded in 1925 in the thirty-three states of the Registration Area was 905 in Delaware.

COMMUNICABLE DISEASES

Pre-war Russia was in many ways a paradox among nations While, politically and industrially, it was one of the most backward of the civilized countries of the world, in many of its intellectual and social activities it was the peer of any The science and practice of medicine may be taken as an instance of this observation though to the lay public of other countries the high minded self-sacrificing Russian physician became a familiar figure only comparatively recently, largely through the artistic works of Chekhov, members of the medical profession knew and valued the work of their Russian confreres long before Chekhov's plays appeared on the boards of our theatres need of sickness reporting was recognized in Russia many years ago and the work of its medical statisticians had deservedly high re-It is not likely that the days of the Revolution have dampened the zeal of the

Russian practitioners for careful scientific work and their reports of sickness probably have a considerable degree of accuracy

We are listing below the number of cases and the case rates per 100,000 population from certain communicable diseases reported in 1925 in the Soviet Union and we are adding for comparison the corresponding figures for the State of New York

Table I Reportable Communicable Diseases Cases and Case Rates per 100,000 Population

Trachoma	845,100	582 6	51	5

^{*} Data not available

In addition to the types of sickness shown in the preceding table there were also recorded in the entire territory of the USSR. 12 cases of Asiatic cholera, 113 cases of glanders, 257 cases of bubonic plague, 485 cases of leprosy, and 46,300 bites by rabid animals. The last figure includes, in all probability, all cases of bites regardless of consequences and therefore, cannot be compared with the experience of this State, since our records show only cases in which the person bitten developed rabies. Most of the cases of plague and leprosy occurred in the Asiatic provinces

The striking facts disclosed in the table are the great prevalence in the Soviet Union of malaria, grippe, dysentery, tuberculosis, and trachoma Persons, who in 1925 were afflicted with malaria to a sufficient degree to require medical attention, numbered five and one-half millions or almost four per cent of the population. The reported cases of influenza numbered almost three million or two per cent of the population. There were eight hundred and fifty thousand reported cases of trachoma and more than three hundred thousand cases of dysentery. The corresponding numbers of cases of these diseases in the State of New York were almost negligible. Cases of tubercu-

losis numbered almost a million and a quarter and the case rate was more than four times the rate in this State. In proportion to the population, reported cases of venereal diseases were also more numerous than in this State. Then we note seventy thousand cases of scurvy, a title not even given in our list of reportable diseases.

It is surprising to find that in the Soviet Union there were relatively fewer cases of diphtheria, the rate being 494 as compared with 1201 in the State of New York. In this connection it is important to remember that here the reporting of diphtheria is practically complete while in the entire territory of Russia many cases are, undoubtedly, never brought to the attention of a physician We shall obtain a better picture of the situation if we compare the prevalence of diphtheria in Moscow and New York City Since Moscow is the center of all Soviet activities, the registration of sickness in that city is undoubtedly more complete than elsewhere in the country In 1926 the diphtheria case rate was 1049 in Moscow and 118.7 in New York City 1927 the Moscow rate was 1511, while the rate in New York City was 2262 In other

words, it is probably true that diphtheria is less prevalent in Russia than it is in this country, although the disparity between the rates may not be as large as the published figures seem to indicate

Causes of Death

No figures are available showing mortality by cause in the entire Soviet Union. We have, however, detailed figures for the city of Moscow. The number of deaths and the death rates from the leading causes in Moscow in 1927 and, for comparison, in New York City during the same year are shown in the following table.

Deaths in Moscow in 1927 totalled 28,209, in New York City, 70,430 The death rates per 1,000 population were 135 and 118, respectively. The mortality from most of the indicated causes of death was higher in Moscow with the following striking exceptions. The death rate from syphilis in Moscow was only 21 as compared with a rate of 92 in New York City. Mortality from cancer was somewhat lower in Moscow, 1013, the New York rate being 1249. The death rate from alcoholism was 114, while the New York City rate was 136. The death rates from homicide and

^{*} Rate per 10,000 total births, including stillbirths.

other types of violence, except suicide, were also more favorable in Moscow. The death rate from the diseases of the circulatory system was 145 2-less than half of the New York It is particularly interesting to City figure note that while the mortality from puerperal sepsis was lower in New York City, the death rate from all other puerperal causes, 382 per 10,000 total births, was more than three times the Moscow rate, 119 The fact that the loss of life in childbirth is higher in this country than in practically any civilized country in the world has been a source of concern to our medical profession for a number of years *

The outstanding negative facts in the Moscow death record are the greater number of deaths from typhoid fever, tuberculosis (all forms), the important diseases of childhood measles, scarlet fever, whooping cough, diphtheria, the diseases of the nervous system, of the respiratory system, and of the digestive The death rate from suicide was organs. somewhat higher than in New York City The greater death rates shown under the rubrics of "old age" and "ill-defined diseases" have no particular significance except as an indication that the Moscow health authorities are less insistent upon the statement of a more definite diagnosis

MEDICAL PERSONNEL

The number of physicians registered in the RSFSR in 1925 was 16,854, or one physician per 5,909 persons. In the State of New York the number of physicians in that year was 17,006, or one physician per 657 persons. The shortage of medical personnel in Russia was particularly

marked in the rural territory which had a corps of 6,333 physicians to serve the needs of more than eighty million people, or one physician per 13,038 persons. If we add to the recorded number of graduates of medical schools the group of Feldshers** we obtain a total of 35,359 medical men, or one per 2,187 persons in the entire territory, while in the rural territory the ratio was one to 4,441

The situation in Russia as regards dental service was even worse. The number of registered dentists was 2,282, or one dentist per 43,643 persons. In the State of New York the corresponding number was 8,430, or a ratio of one to 1,326

Registered midwives numbered 5,411 in the Federated Republic, or a ratio of one to 18,406 persons, the corresponding figures for New York State were 1,767 midwives or a ratio of one to 6,323 persons

Conclusion

The purpose of this paper has been to present in brief form the outstanding facts regarding the health situation in Russia. No attempt has been made to relate the facts to the monumental political and social changes through which Russia is passing. In fairness to the present government we must remember that the high death rates, the great prevalence of certain epidemic diseases, the inadequacy of medical services were among the legacies of the imperial regime. Whether or not the new order of things will bring about an improvement in health conditions, only time will show

SINUS CONDITIONS ASSOCIATED WITH COUGH IN TUBERCULOSIS*

By H ST JOHN WILLIAMS, MD, POUGHKEEPSIE, N Y

THERE is no doubt but that soon after the creation of man, respiratory affections made their advent into the scheme of things

Although classified as a symptom, a cough has been the despair of physicians and the nightmare of patients. The first cough usually happens shortly after birth, an effort on the part of Nature to clear the baby's respiratory tract of mucus. Throughout all the rest of life, at some seasons of the year and for one reason or another, Nature attempts to get rid of irritating material in the respiratory tract, by means of the cough

From earliest times, therapeutic agents in great

*Read at the Annual Meeting of the Medical Society of the State of New York at Albany, N Y, May 22 1928.

numbers have been tried in the treatment of coughs, the ultimate object being to ease the cough and give the sufferer relief Except in certain types of tuberculosis and malignant coughs where sleep is imperative, it is bad practice to fall back to sedatives and narcotics because it is not assisting nature nor having the desired systemic effect on the cause

We believe the main etiological factors in chronic cough are, first, pulmonary infiltrations and thickenings with or without enlarged root glands most often following pneumonia, influenza and sinusitis and, second, enlarged bronchial root glands and peribronchial thickening and bronchiectasis Eighty per cent of the cases

^{*} See Maternal Mortality and Stillbirths in New York State 1915 1925 published by the New York State Department of Health, 1928

^{**} Feldshers in pre war Russia were graduates of elementary professional schools in which they were taught the rudiments of medical theory and practice. Feldshers were permitted to engage in medical practice under the guidance of a physician while in rural districts many medical centers were largely in charge of only a Feldsher.

of bronchiectasis are associated with infection in the upper respiratory tract

Any respiratory infection may cause inflammation of bronchial root glands, engorgement of blood vessels or enlargement of bronchi

They cause routinely symptoms of cough and expectoration extending over a long period of time. Where no organism can be found and where X-ray and physical findings are negative, they are not called positively tubercular yet when we realize that all active tuberculosis has a history of months of coughing, is it not probable that a certain percentage of this undiagnosed group will become tuberculous? By recognizing this eventuality, we should be able to devise methods to prevent it.

We have done much in the recognition of beginning pulmonary tuberculosis. Why can we not accomplish equally as much in the early recognition of non-tuberculosis and inflammatory bronchitides.

.While authorities and statistics differ as to percentages, it is estimated that from 5 to 16% of diagnosed pulmonary tuberculosis is not tuberculosis, and because of that condition, every persistent cough should be investigated by a nose and throat specialist, as sinusitis is apparently the largest etiological factor in this non-tubercular group of chronic coughs

I wish to cite the following examples of the disappearance of cough following the treatment of infected sinuses

A High School Student, 16 years old, negative past history, following a severe cold and bronchitis, developed a chronic cough with profuse expectoration, lost weight and strength, developed night sweats and had occasional attacks of haemoptyses Diagnosed pulmonary tuber-At this time came under treatment Physical signs were comparatively negative, sputum negative for tubercle bacilli X-ray showed bronchiectasis The general condition and cough did not improve under the routine treatment for tuberculosis Sent to nose and throat specialist who found and cleaned up an infected spenoidal sinus and the general condition rapidly improved and the cough stopped

A Factory Worker, 23 years old, negative past history, gradual onset of cough, expectoration, weakness, fever, loss in weight, hoarseness Diagnosed as pulmonary tuberculosis. At this

time, came under treatment Diagnosis confirmed by physical examination, sputum and X-ray Most marked symptom was a severe and uncontrollable cough Condition gradually failing, laryngitis became more severe and an increasing deafness developed Sent to nose and throat specialist who cleared up infected sinuses and helped the ear condition. The cough greatly diminished and the general condition, pulmonary condition and laryngeal condition improved steadily so that patient is now almost well

A Saleswoman, aged 42 years, following frequent colds and long hours on her feet began feeling over-tired, exhausted, lost weight, developed cough and expectoration, became faint at work, examined by company physician and diagnosed as pulmonary tuberculosis time came under treatment Past and family history negative, sputum negative, physical signs and X-ray practically negative, a questionable diagnosis of tuberculosis made, cough in this case not severe but patient sent to nose and throat specialist because of frequent and severe headaches Infected sinus drained and cleared up, headaches relieved and also the patient cured of her other symptoms with a remarkable gain in health, weight, strength Able to return to home and business

A Housewife, aged 58 years, yearly attacks of bronchitis and asthma, growing more severe each year with severe cough, marked prostration, anaemia, dyspnoea and increasing sputum occasionally blood streaked At this time came under treatment for tuberculosis but responded very slightly and was continually prostrated by asthmatic attacks and coughing spells Sputum negative, physical signs of chronic bronchitis X-ray Sent to nose and throat showed bronchietasis specialist because of headaches Infected sinus cleared up and whole general condition improved with practically complete loss of cough, no asthmatic attacks, gain in weight and strength and patient able to return again practically well to her home and family

This small group while far from conclusive is suggestive of the benefits and satisfaction to be derived from cooperation between the chest specialist and the nose and throat specialist. The positive case of tuberculosis has been greatly helped, the non-tuberculous cases returned to health and possibly prevented from becoming tubercular.

NON-OPERATIVE TREATMENT OF INTUSSUSCEPTION*

By GEORGE M RETAN, MD, SYRACUSE, N Y

E have been taught that the only treatment for intussusception is a surgical operation Before the advent of surgery and during the earlier days when surgery presented greater dangers, intussusception was treated by the injection of fluids into the colon or by the induction of gas in to the large bowel. There are many cases of intussusception recorded in the literature that have been successfully treated in this manner. The largest series are those reported by Koch and Oerm consisting of 400 cases treated by enema. The mortality in this group of cases treated non surgically was lower than a similar group freated surgically. The deaths were due to an incomplete disinvagination of the bowel

I have developed a new method of reducing intussusception that eliminates this danger and makes the non-surgical treatment safe

I published a report in the American Journal of Diseases of Children for May, 1927 About the same time Dr V R Stephens of Berwin, Ill, reduced intussusception using the same method and published this article in the same Journal, January 1928 The description of this method follows

The child is placed on a horizontal fluoroscopic table and barium in water is injected into the rectum by gravity under a pressure of 3 or 4 feet The barium will stop at some level below the intussusception The barium supply is turned off There is then a column of barium in the colon and above this a column of gas. Above the gas is the obstruction The inner side of one hand is placed transversely across the abdomen to apply pressure on the sigmoid This is done to prevent the barium from escaping Pressure is carefully and intermittently made on the colon with the palm of the other hand, forcing the barium upward This advancing barium forces the gas upward, distending the colon and exerting an even pressure against the obstruction The result of this procedure is watched in the fluoroscope

If the obstruction is not relieved, the column of barium will be seen returning when the pressure is removed. This pressure should be applied intermittently while the operator is watching the result thru the flouroscope. If the obstruction is relieved the colon should be filled with barium and its outline carefully studied. If the colon cannot be completely outlined, the child should be operated.

CASE REPORTS

Case 1 W F H, a boy, aged 9 months, was seen Sept 21, 1926, with the complaint of a nasopharyngitis and croupy cough since Sept 17

Castor oil had been given the day before examina-

The tissues were flabby, the fontanel was 2 inches wide, the parietal bosses were thickened, and definite rosary was present. There were no teeth. The chest, heart and abdomen were normal. The nose and throat were inflamed. The temperature was 98.0

On September 22, the stools, passed four times daily, were loose, and continued to be loose until September 26, when the infant vomited the feeding given at 6 am and continued to vomit at intervals during the morning. In the afternoon, vomiting was much less. The vomitus contained saliva and mucus At 5 pm there was a bowel movement containing fecal material was examined in the afternoon An abdominal tumor was not found The temperature was normal, and except for a few fine rales heard in the bases of the chest, the observations were negative The infant seemed better during the night but vomited again at 10 a m on September 27 There had been a mucous stool at 4 a m The mother reported that he acted as if he were in a stupor and slept except at intervals when he cried out as if in pain

On examination, the extremities were cold A few scattered fine bubbling rales were heard posteriorly in the lower part of the chest domen was relaxed Evidence of tenderness or muscle spasm was not present. Above the navel in the midline could be felt a sausage shaped tumor about 4 inches (10cm) long The temperature was 98 6 and the pulse 140 A diagnosis The infant was of intussusception was made placed on a horizontal fluoroscopic table, and barium was injected slowly by gravity into the It would only enter to the junction of the sigmoid and the descending colon Manual pressure as described above was applied to the abdomen, forcing the column of barium upward along the descending colon The procedure was repeated about six times when the resistance was suddenly relieved and the bowel partly filled with barium A roentgenogram was immediately taken and shows the intussusception partly disinvagin-More barium was then injected and the colon completely filled Attempt was then made to palpate the tumor and it could no longer be felt

The attitude of the infant immediately changed from apathy or irritability. He seemed hungry and cross when disturbed. He was given diluted orange juice, containing some sugar every half hour. Further vomiting did not occur. Recovery was complete.

Case No 2 P M P, a girl, aged 1 year, was seen January 2, 1926

^{*}Read at the Annual Meeting of the Medical Society of the State of New York, at Albany, N Y, May 22, 1928

There was a history of nasopharyngitis for the past ten days. For three days the stools had been loose. There had been nine stools during the last 24 hours. The baby vomited several times during the day. Examination was negative except that abdomen was slightly tender, generally

On January 3rd there was only one stool This contained blood and mucous. The vomiting continued. The physical examination was negative except for the persistence of slight abdominal tenderness. The abdomen was reexamined carefully several times because of a suspicion that the baby was developing an intussusception. No tumor could be felt however. Rectal examination was negative. Temperature 98. Pulse 120.

At 5 pm baby was again examined She had continued to vomit at intervals of about fifteen minutes. Temperature was 100 Pulse 160 The baby appeared to be in shock. The extremities were cold, the eyes were dull and listless. There was a fretful cry. There was a sausage shaped tumor lying transversely across the abdomen at the level of the umbilicus. The baby was taken to the office and placed under the fluoroscope. A suspension of barium was injected into the rectum.

The suspension entered to the splenic flexure where it stopped suddenly. The right hand was pressed against the sigmoid to prevent the escape of the barium and with the other hand pressure was applied to the descending colon.

Several times during this procedure the bowel emptied as it seemed to be extremely sensitive (The baby had had a colitis for 3 days)

Each time the colon was refilled and pressure was again applied forcing the suspension upward

The colon was then filled to see if the intussusception was completely relieved

Immediately following the reduction of the intussusception the baby changed The dull expression in the eyes became bright and the mother remarked that the baby looked natural again The abdominal tumor could no longer be felt

She was given two ounces of water every two hours and this was not vomited. During the night she passed gas several times from the bowel. The baby made an uninterrupted recovery

Case No 3 S A G, a girl, aged 9 months, was seen March 5, 1926 She had been breast fed When 2 weeks old she had had attacks of breath holding with cyanosis which were promptly relieved by roentgen-ray treatment of the thymus

gland This had not recurred On March 4, she began to vomit at 5 30 pm. and continued vomiting at intervals during the night. She passed a mucous stool containing blood during the night

The infant was first seen at 4 pm, March 5 She had vomited three times during the day a greenish fluid containing mucus. She had slept during the day but had awakened at intervals, crying as if in pain

The infant appeared sick The eyes were sunken, the fontanel was depressed, extremities cold Examination of nose, throat, chest and heart The abdomen was relaxed was negative mass was felt above and to the right of the navel This mass seemed about 3 inches (76 cm) long and about the thickness of a thumb The temperature was 101 and the pulse 150 A diagnosis of intussusception was made. The abdomen was examined under the fluoroscope Barium in water was injected into the colon and passed upward beyond the spleme flexure and across the transverse colon for a distance of about 3 inches Here it stopped abruptly. Manual pressure then was exerted carefully in an effort to disinvaginate the bowel, but without success The infant was immediately taken to the hospital and operated Intussusception was not found The ascending colon and the first part of the transverse colon were twisted into a mass and were blue twisting was relieved by the surgeon, and the infant recovered

Case No 3 illustrates the necessity for immediate operation if the obstruction is not relieved by this method. The abdomen must be opened if the colon cannot be completely visualized following the reduction of the intussusception or if the patient is not relieved of symptoms.

Provided the above described procedure is carefully followed, there can be no danger in using this method. We have the following means of determining if the obstruction is entirely relieved.

First, complete visualization of the colon This is still more emphatic if some of the barium can be forced into the ilium

Second, relief of symptoms It is surprising to see the immediate relief of all symptms of shock following the complete disinvagination of the bowel There should be no more vomiting and gas is passed from the bowel The abdominal tumor disappears

If there is doubt as to the complete reduction, the abdomen should be opened at once

EPIDEMIOLOGY OF WHOOPING COUGH* By EDWARD S GODFREY, JR, MD, ALBANY, NY

SUFFICIENT excuse for reviewing the epidemiology of whooping cough is that in 1926 it caused more deaths in New York State, exclusive of New York City, than any of the other acute communicable diseases of childhood (Fig 1)—nearly 60 per cent more deaths than from diphtheria or measles, more than 3½ times as many deaths as from scarlet fever This is not due to any comparative increase in prevalence or to any accession of virulence The death rate shows a tendency to decline though at a slower rate than the other diseases mentioned The principal reasons for this are that we have not at our disposal the reliable prophylactic and therapeutic agents that we have in diphtheria, there has not been the great decrease in virulence which has marked scarlet fever, and we have not made the progress in impressing the public as we lately have in measles with the importance of proper care and the danger of the disease to young children

ogy of the disease The cause of the paroxysmal nature of the cough is unknown

The specific bacilli are thrown out in large numbers during the act of coughing during the so-called catarrhal stage and in diminishing numbers in the paroxysmal stage. As might be expected from this, the disease is most readily communicated during its early stages, especially during the catarrhal stage when from the symptoms the true nature of the affection can only be suspected The disease may be transmitted over a period of several weeks as in the case of so-called "Pertussis Pete" cited by Luttinger Whether there are healthy human carriers or not remains to be discovered Although so designated "Pertussis Pete" was not a "carrier" in the usual sense since he was still coughing when he caused the last case attributed to him

Although a disease of the respiratory tract and presumably transmitted by the secretions

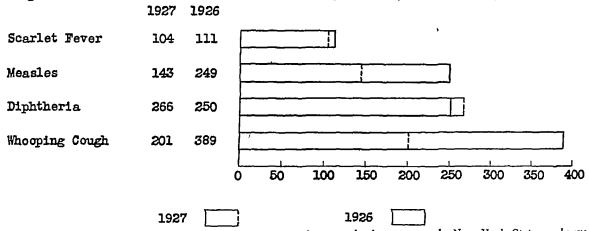

Fig 1-Number of deaths from scarlet fever, measles, diphtheria, and whoaping cough, New York State, exclusive of New York City, 1927 and 1926

A further excuse for such a review is found in the paucity of epidemiologic data and the maccuracy of much that has been published Whooping cough is apparently an epidemiological anomaly and is worthy of intensive field investigation by local health departments both in order to develop needed basic information and to test practical measures for reducing the mortality

The generally accepted exciting cause of whooping cough is the Bordet-Gengou bacillus which proliferates so numerously as to pack the interstices between the cilia of the trachea, thereby mechanically preventing their normal movement. This packing of the ciliary interstices constitutes the only specific pathol-

from the respiratory tract of an infected individual reaching the respiratory tract of a susceptible individual, whooping cough has not the well marked summer decline that characterizes other diseases believed to be thus transmitted (Fig 2) Diphtheria shows its greatest incidence in the late fall or early winter, pneumonia, in the late winter or early spring, measles and scarlet fever from March to June On the other hand our New York State figures do not show, on the average, a summer increase in prevalence as stated by several writers on the subject, although in two successive years (1916 and 1917) the maximum number of cases were reported in July (Table 1) In eleven of the last 15 years the maximum has occurred in the months of November, December, January and February Once

^{*}Read at the Annual Meeting of the Medical Society of the State of New York, at Albany, N Y, May 22, 1928.

each it has occurred in May and March The maximum month in all these years however has seldom been as much as three times the number of cases of the minimum month though twice it has had five times and once six times as many The month of minimum cases is usually September (7 times) or October (3 times) of the average minimum month to average

Number of cases reported each month—New York State, exclusive of New York City Monthly maximum in bold face Monthly minimum in small type.

maximum month for cases has been 48 100 Measles by contrast shows 5 100

On the other hand there is a very sharp rise in the August mortality of whooping cough, 95 per cent of the deaths of the past 14 years falling in that month (Fig 3) The highest mortality has been in March with 117 per cent of the annual deaths from whooping cough. The indicated case fatality rate is highest in September (44 per cent) with August (42 per cent) second (Fig 4). This would seem to contradict the commonly repeated statement that the disease is milder in warm weather. This indicated fatality rate is not due, entirely at least to greater

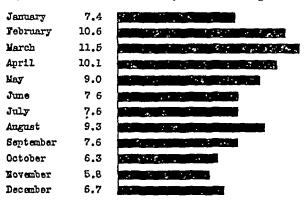

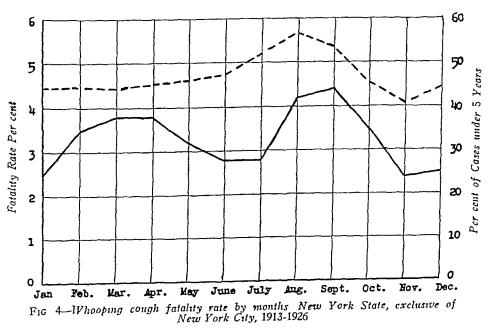

Fig 3

Percent distribution of deaths from whooping cough by months, New York State, exclusive of New York City 1913-1926

malignancy in the disease during those months A similar rise is observed in the "off season"

of all other communicable diseases and is partly due to the lag of the deaths behind More than half of the whooping the cases cough cases die subsequent to the second week of the disease, hence a month of low morbidity following a high one will show a higher fatality rate since the deaths are charged to the month in which they occur instead of to the month in which the disease begins Another factor is the higher percentage of cases among young children during the summer months the disease is much more fatal in early childhood, a higher percentage at this age means a higher percentage of deaths regardless of other considerations (Fig 4) An additional cause is found in the tendency to report cases more completely during periods of prevalence and even more perhaps in the tendency of people to call a physician during such periods we think works in two ways to reduce the indicated case fatality rate (1) Cases are better reported and (2) cases are given better care and an actual decrease also occurs

Whooping cough presents another variation from the usual epidemiology of respiratory diseases, viz—in general throughout the registration area of the United States the death rate is higher in rural than in urban communities taking 10,000 population as the dividing line. This is not true in New York State, or in New Jersey, or in the New England States but does hold true for the west and south (Fig. 5). The disease is much more fatal in negroes in the South than for whites, and in the South negroes are relatively more numerous in the

Solid line—Fatality rate (Deaths per 100 cases) All ages

Broken line—Per cent of total whoofing cough cases in children under 5 years

rural than in the urban districts. But this cannot account for this peculiarity elsewhere. In New York the highest average death rate for the past 12 years has been in places of from 10,000 to 20,000 inhabitants, it has been lowest in villages of less than 2,500, the latter observation being true also of diphtheria, scarlet fever and measles (Fig 6). The death rate for the unincorporated towns (the "truly rural' section of the State) is somewhat higher—an observation which is also true of scarlet fever, diphtheria, measles and poliomyelitis. We interpret this as indicating less efficient

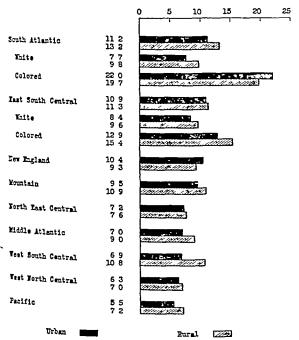

Fig 5—Death rates, per 100,000 population, from whooping cough US Registration Area by Geographical Divisions, Urban and Rural 1919-1923

care due to a smaller proportion of the cases having medical advice and nursing service

A third anomaly of whooping cough is its higher death rate in southern than in northern states, partly but not wholly accounted for by the greater mortality among negroes (Fig 5) Here again is a contradiction of a frequently encountered statement that the disease is milder in warm countries than in cold Whether it actually is less frequent or less fatal in tropical countries is a point we have not determined as the data is not immediately available

Still a fourth peculiarity of whooping cough is its preference for females. It is generally stated that the majority of cases and deaths at each age are among females although our New York State figures show that under 1 year the males slightly exceed the females (Table 2). The average ratio at all ages in New York State, exclusive of cities over 200,000 is 106 cases among females for every 100 among males and 112 deaths among females for every 100 deaths among males. The case fatality rate was 2.72 per cent for males and 2.87 per cent for females at all ages.

When we come to the age distribution of the cases and deaths we find a stronger incentive to postpone the attack until after the third year at least, than we do even in First, because of the very high fatality rate in very young children, and, second, because there is apparently a decrease in susceptibility, independent of a recognized attack, as years go on It is quite possible that with the development of the larynx, the characteristic "whoop" is frequently absent and the symptoms less distressing in a considerable The Boston Whoopproportion of the cases ing Cough Commission has found that 4 per cent of the cases coming under their observation gave

positive cultures for the Bordet-Gengou bacillus although they never coughed or vomited during the entire course of the illness. Postponement therefore means not only fewer deaths but possibly a smaller proportion of cases with distressing symptoms

Ninety-five per cent of the deaths occur during the first five years of life, 60 per cent in children under 1 year old, 80 per cent in children under 2 years (Table 3) Unlike measles there is no period of congenital immunity Children are susceptible at birth and about 3 per cent of the reported cases occur during the first year of life. It is impossible to state with any accuracy the case fatality rate since whooping cough is the most poorly reported lethal communicable disease of childhood (Table 4) Mumps, German measles and chickenpox are probably no better reported but since they seldom cause death the fact is of less practical importance

One reason for this poor reporting is probably that relatively few cases are seen by physicians or if seen, it is during the catarrhal stage and a diagnosis of whooping cough is not made After the "whoop" begins many mothers, and practically all grandmothers, consider themselves quite as competent as a physician to deal with the situation Considering the rather uncertain results obtained from drugs and vaccines their opinion is possibly justified so far as older children are concerned but not for those under five years old Another reason for the poor reporting of whooping cough is that the cases are seldom investigated and followed up to discover missed and unreported previous cases and subsequent cases among Luttinger investigated 2310 cases contacts in New York City and determined the source

of infection in over 88 per cent of them. If this could be done in New York City it should be possible to ascertain the source in over 95 per cent in smaller places, and in this event whooping cough would be well reported.

From the available figures, however, it is

WHOOPING COUGH

possible to state with considerable certainty that the disease is very fatal during the first two years of life, quite fatal during the third year and rarely fatal from the fifth to the fifteenth year. Our figures for the five years 1920-1924 show a fatality rate of 16 per cent among children attacked under 1 year of age, 6½ per cent at age 1, a little less than 2 per cent at age 2 (Table 3) These indicated rates are about twice as high as for measles at the same ages and

WHOOPING COUGH

*Urban = Places of 10,000 population and over *Rural = Places under 10,000

Table 4—Average per cent of deaths found not to have been reported as cases—New York State exclusive of New York City—1922-1926

as previously stated emphasize the importance of at least deferring the attack

Whooping cough is apparently the most common communicable disease in the preschool years—at least of those which frequently cause death A series of "disease cen-

suses" taken in various communities in this State have shown very nearly 50 per cent of those entering school to have already had an attack Since it is among this 50 per cent that 95 per cent of the deaths occur, control through the schools can be of but little benefit Such control would probably be futile in any event if Luttinger's findings in New York City hold true elsewhere Of the 2310 cases which he investigated over 1500 acquired their infection through neighborhood contact and only 6 per cent through the schools

The deductions to be drawn from the foregoing facts seem to point to the necessity of epidemiological studies of the disease in various localities, in order to fill in the gaps of our present knowledge and to test out promising methods of control or of at least reducing the death rate There are no tables extant such as we have for scarlet fever, diphtheria and measles showing the number of non-immunes who escape the disease in families in which a case occurs In consequence we have no basic data with which to compare the results of specific prophylaxis or the results of attempted isolation in the family We also need better data for determining more nearly the precise fatality rate at different ages and a number of controlled observations on the results of prophylaxis and treatment is also great need for some practical means of making an early diagnosis in the absence of the characteristic paroxysmal cough The socalled cough-plate method is entirely too elaborate for everyday use by the general practitioner

The Boston Whooping Cough Commission reports that about 60 per cent of exposed persons given large doses of freshly prepared whooping cough vaccine did not contract whooping cough. The vaccine was prepared from strains of the Bordet-Gengou bacillus which induce a high agglutination in injected animals Their first dose, either prophylactically or therapeutically, consists of ten billion organisms in a 1/2 cc dose, followed in forty-eight hours by twenty billions and forty-eight hours later by thirty billions Therapeutically forty billions

are given at four to five day intervals through the paroxysmal stage It was recently stated by Dr Lawrence Smith that ordinarily a total series of four to five injections was sufficient The prophylactic doses should be given within the first few days after exposure, but if a longer interval has elapsed a fourth dose of forty billion should be administered. It is believed by the Boston Commission that even though the disease is not entirely prevented the course is aborted According to this Commission, the X-ray treatment is most useful in clearing up long standing cases in older children and is also beneficial in the earlier stages in very young infants

It seems to me, however, that from a practical standpoint our greatest need is to see that young children are protected as far as possible either by isolation or by vaccine, or by both, and that if attacked they be given the benefit of medical advice and such nursing care as the community can afford This means carrying out much the same plan for whooping cough as for measles—a warning to the general public through the newspapers of the presence of the disease in the community, of its dangers, especially in early life, of the distressing nature of the disease even in older children, and of the possibility of preventing or modifying the disease through the timely use of vac-It means a particular warning to the parents of small children either through the distribution of pamphlets through school children or through the mail, or as far as possible by personal visits by the public health It means a follow-up of the reported cases for the purpose of discovering other cases, especially children under 5 years old, in the family or neighborhood and through them contacts or potential contacts things will serve to awaken the public to the very great danger of the disease and result in more of them being given adequate care, a reduction in the number of complicated cases, quite possibly a reduction in the incidence of the disease—especially during early life, and almost certainly a reduction in the number of deaths

THE CANCER SITUATION IN THE STATE OF NEW YORK, IV THE 1927 STATISTICS

By JOHN M SWAN, MD, FA.CP, ROCHESTER, N Y
Chairman of the New York State Committee of the American Society for the Control of Cancer

The 1927 statistics of mortality in the State of New York were published by the Health Department as of March, 1928 Under the title "Outstanding Facts," the Department of Health says "Cancer, with the highest death rate yet registered, is now second in importance among the causes of death. In 1926 it was third, in 1917 it was fifth, and twenty years ago it was eighth"

Cancer was responsible for 14,254 deaths in 1927, against 13,613 in 1926, an increase of 641, or 47 per cent. The annual average for the years 1922-1926 was 12,714, so that the increase of 1927 over the annual average was 1540, or 121 percent.

The death rate per 100,000 population was 1243 in 1927, against 1203 in 1926, an increase of 33 percent. The annual average deathrate for the years 1922-1926 was 1153, an increase for 1927 of 90 percent.

In the State of New York, outside of New York City, the total deaths for 1927 numbered 6,806, against 6,580 for 1926, an increase of 226, or 34 per cent. The annual average for the State outside New York City for the years 1922-1926 was 6,192, so that in 1927 there were 614 more deaths than the five year average, or 99 per cent.

The death rate per 100,000 population was 123 8 against 122 0 in 1926 an increase of 14 per cent. The annual average deathrate for the five year period 1922-1926 was 119 1, so that the 1927 rate was 47 per cent. higher than that of the five year period.

The following twenty counties had death rates lower than that of the State outside New York City *Broome, 1171, *Cattaraugus, 1084, *Chautauqua, 1038, *Clinton, 872, *Erie, 1196, Franklin, 1025, Genesee, 1164, *Herkimer, 1212, *Livingston, 1096, *Monroe, 1221, *Montgomery, 1180, *Niagara, 1035, *Onondaga, 1152, Putnam, 1140, *Rockland, 927, *Schenectady, 1104, Schoharie, 1200, *Schuyler, 1177, *Sullivan, 653, *Tioga, 1043

In 1926 the highest death rate in the State was given by Cortland County (1883), in 1927 the highest rate was given by Columbia County (1832), Cortland County having a rate of 1456 Except in Hamilton County, in which no deaths from cancer were recorded, the low-

est rate for 1927 was given by Sullivan County (653)

In the counties with the largest populations the rates are Erie, 1196, Monroe, 1221, Onondaga, 1152, Oneida, 1383, Albany, 1450, Broome, 1171, Niagara, 1035, Chautauqua, 1038, Orange, 1321, and Schenectady, 1104

In the counties in which there are Medical Schools, the rates are again below the rate for the State at large, except in Albany County Albany, 1450, Onondaga, 1152, Monroe, 1221, Erie, 1196

The question of cancer belts may again be answered by a negative, taking the same groups of counties that were used in the paper on the 1926 statistics (1) Central Group Cortland, 1456, Cayuga, 1673, Chenango, 1422, Tompkins, 1505, Onondaga, 1152, Tioga, 1043, Broome, 1171 Northwestern Group Niagara, 1035, Orleans, 1588, Monroe, 1221, Livingston, 1096, Genesee, 1164, Erie, 1196 The Southern tier, Chautauqua, 1038, Cattaraugus, 1084, Allegany, 1358, Steuben, 1368, Chemung, 1543, Tioga, 1043, Broome, 1171, Delaware, 1372, Sullivan, 653

The highest rates for 1927 were reported from Cayuga, 1673, Chemung, 1543, Columbia, 1832, Dutchess, 1627, Essex, 1556, *Fulton, 1655, *Ontario, 1654, Orleans, 1588, Otsego, 1609, Tompkins, 1505

COMMENT

- 1 The death rate in the State outside of New York City was lower in 1927 than that of New York City itself and lower than that of the State as a whole This is the first year that this has been the case
- 2 The counties in which the teaching institutions are located have death rates lower than the rate in the State outside of the City of New York, except Albany
- 3 There is no evidence, from the study of these statistics, of the existence of a "cancer belt" in the State

GUMMA OF ORBIT*

By THURBER LeWIN, M D, BUFFALO, N Y, AND CLEVELAND WHITE, M.D, CHICAGO, ILL

TUMMA of the orbit is of infrequent occurrence, when encountered, it usually presents some degree of difficulty in di-An opportunity to thoroughly study such a lesion recently and its rapid involution under one of the newer antiluetic remedies form the basis of this report

CASE REPORT

A man of 42, excellent general health, had been refracted by one of us (T L) in December, He had worn reading glasses for five jears, his eyes having been tested by an optometrist. Under a cycloplegic, a compound hyperopic astigmatism was found in each eye and glasses were ordered to correct this condition A complete ophthalmological examination showed the media to be clear, nerve heads of good color, sharply defined, central cupping and lamina cribosa visible, the vessels, maculae and periphery negative

Approximately ten months later his left eye began to rapidly protrude and his vision was becoming greatly impaired in one week's time As his condition grew worse, the eye began to Thinking he had an acute rhinitis, he consulted a throat and nose man whose examination was negative but advised an X-ray of the This was done, and at the same time the roentgenologist, at the patient's suggestion included a dental X-ray The report was made that a hazy mass was present, apparently deep in the left orbit, in the medial upper portion As it was thought possible that this mass was connected with a sinus, both ethmoid and sphenoid sinuses were opened but nothing was found. He was then requested to have his eyes rechecked

Ophthalmological examination was as follows, Viz OD externally negative, media clear, nerve head slightly oval, axis 90 degrees, of good color, sharply defined edges, central physiologic funnel cupping with lamina-cribrosa plainly Vessels were normal, arterial venous balance good, macula and periphery were negative Vision's gl 6/15-2, c.gl 6/6

OS globe markedly protruding, media clear, disc hyperemic, round, edges very blurred, no cupping noted The veins were somewhat overfull and there were several areas of retinal No hemorrhages nor exudates were noted and the macula and periphers were negathe Vision s gl 6/60 c gl 6/60 Upward rotation was somewhat restricted

Because of the clinical appearance of the tumor, the X-ray findings and the sudden appear-

ance, a blood Wassermann was taken to check the

strong possibility of its Leing a gumma The blood Wassermann with the Kolmer Standardized technique was strongly positive

TREATMENT

To avoid a therapeutic shock (Hernheimer) it was decided by one of us (CW) to institute treatment with bismuth following Stokes' 1 cardinal principles to eliminate such a reaction, especially the focal phase. Bismuth was given once weekly for six doses with potassium iodide internally, the tumor shrank very decidedly in size A course of arsphenarmine was then given and there was very little diminution in the size Continuing treatment with bisof the tumor muth, the gumma began to shrink in size again

There has been a gradual but not complete subsidence of the protrusion and a full return of vision to 6/6 correction. There is one degree The nerve head is very slightly of exophoria paler than normal with sharply defined edges, vessels, macula and periphery remains negative The spinal fluid examination was essentially negative

COMMENTS

De Schweinitz² quotes Mracek that syphilitic periostitis most frequently attacks the orbital margins, and may occur in a gummatous or a sclerosing form, the site is usually in the upper or outer wall and causes symptoms in accordance with its size and location Tuberculous periostitis occurs chiefly in children and usually in outer or lower margins

Ball 3 states that the periosteum of the orbital bones is occasionally attacked by lues in its tertiary stage though it occurs much less frequently there than in the other cranial bones

The response to bismuth therapy combined with iodides is worthy of notice but its worth in such cases can only be evaluated by use in a large series of such lesions

Summary

A brief description of a gumma of orbit is reported because of the unusual diagnostic difficulties encountered. Bismuth therapy played an unportant part in its resolution

AID FOR NEEDY PHYSICIANS

By LINSLY R. WILLIAMS, M D, NEW YORK, N Y

E have received during the past few years inquiries as to the number of elderly physicians who are in need of relief and suggestions of several methods of aiding them

A recent suggestion recommends that an annuity and insurance fund be created which would grant to every physician at the age of sixty or sixty-five a sum of \$100 a month and that an endowment fund of a million dollars would be needed to pay for the management expenses. It is obvious that such a fund would be desirable, and that the earlier a physician began payments toward a fund the smaller the amount of money that he would pay would be. A plan to provide a fixed sum annually at the age of sixty or sixty-five would require the payment of fairly large premiums annually for physicians who were forty years of age or more

Several efforts have been made to relieve physicians and their families when in need, the earliest of which was the Society for the Relief of Widows and Orphans which was a membership association organized in 1842 which pays to widows and children of members in varying amounts a total of from \$1,000 to \$15,000 annually. The annuities amount to a maximum of \$900 a year and less if the widow has an income of her own

The New York Physicians Mutual Aid Association is primarily a non-profit making insurance company in which the beneficiary receives \$1,000. This Association will loan to its members up to \$500 without interest and if this money is not repaid the amount loaned is deducted from the face value of the policy upon the death of the member. The rates for insurance in this Association are the same irrespective of the age of the applicant, but no members are accepted who are over forty-five years of age.

Neither of these associations can act as a relief association for a needy physician.

The Eastern District Medical Society of New York City raises money from its members and friends which it uses in granting annuities to needy physicians without regard to race, creed or color

Under the leadership of a number of prominent physicians an effort has been made during the past few years to raise money to create the New York Physicians Home No permanent building has as yet been obtained but a small number of retired physicians have been cared for

There are several insurance companies which

furnish health and accident policies primarily for physicians

Two questions present themselves Do physicians as a class need a cooperative fund which will provide an annuity for each member at the age of sixty or sixty-five? Second, are there a sufficient number of physicians, who through ill health or financial reverses are in need of financial assistance, to require the organization of a physicians' relief association?

If a plan were devised for a cooperative fund to grant an annuity for all who belonged to it, it would undoubtedly be limited in scope, for the larger number of young persons, whether physicians or not, either anticipate financial success or long life or take out insurance from regular life insurance companies. Unless such a scheme could be made compulsory for all physicians or at least for physicians who were members of the State Society, the numbers insured would be limited and it is quite likely that those who were in later life in need of financial aid would not be members of the fund

There are a certain number of physicians who are in need of relief, but exactly how many in this state is not known. Studies made by the New York Physicians Home discovered a score or more of physicians who needed and were willing to accept what practically amounted to almshouse care.

The physician who has led a busy and active life but whose earnings have not been sufficient for him to set aside a sum to care for him in his old age is usually a self-respecting type of individual who should not go to a home for the aged whether restricted for physicians or others, but preferably should be cared for in the home of a relative or friend, and if necessary, an allowance should be made to assist the family which cares for him

How large a number of physicians there are in this class is not known nor can it be determined without a study being made, and it would seem unfortunate to undertake the organization of a new fund for the relief of physicians or their families or the organization of an annuity fund without determining in advance the average age of physicians engaged in practice and some definite information as to the incomes available for physicians sixty years of age or over It would seem wise to make a study in order to ascertain if it is essential to provide allowances of some kind for needy or aged physicians If after such a study is made this were found to be necessary, then a proper organization should be created by the physicians themselves and not by any outside agency

SKETCH OF A PLAN TO FOUND AN ORGANIZATION TO PROVIDE PENSIONS FOR PHYSICIANS AFTER THE AGE OF SIXTY YEARS

By EDWARD L MEIERHOF, MD, NEW YORK, N Y

THE medical profession has, for generations, given itself most freely and unselfishly to the amelioration, saving, and prolongation of life. In fact, much of the effort and time has been expended without any financial compensation. Is it not therefore possible that the members of the profession should plan to do something for themselves at a time of life when their earnings, for one reason or another, are apt to decline?

Judging the future on the basis of the past alone, the economic struggle for the doctor is a most difficult one However, the cost of training, in time and money, required to become a properly qualified physician today is so much greater than a generation ago, that comparison becomes almost impossible In addition, the present cost of initial equipment, in the way of rent and other overhead expenses, makes it highly needful for the beginner to obtain, quickly, a proper income from his professional work if he is to survive and not be weighed down with financial handicaps The fact that there is a gradually increasing encroachment into the realm of the individual doctor by corporate and institutional bodies is likewise relevant

Another phase of the question is presented in the great mental strain to which the physician is subjected, due in great measure to the complexity of scientific demands upon him. It therefore appears doubtful that the future doctor will be able to stand this mental strain during the later years of life.

So that without further consideration of the many obvious conditions which influence the financial status of the physician, it is felt that some monetary provision should be made for his later years. There are many who would retire from work, let us say, at about the age of sixty to sixty-five years, if they were able to do so, but in many cases the income from their savings is madequate for this. The proposed establishment of homes and special funds for down-and-out doctors shows that there must be a need of this kind—to a limited extent, it is to be hoped

The ideas embodied in the Pension Plan are such as to do away with the humiliation of charity. The purpose of the fund, or foundation, is that every member shall automatically be made a recipient of a pension. The sum of \$1,200.00 is fived as a tentative amount to be paid. Twelve hundred dollars annually may not seem to be a large sum, but if this amount is added to an otherwise inadequate income which the doctor may have, it will mean much to many individuals

It is proposed, in the beginning, to enlist the support of at least 10,000 physicians, who will pay \$75 00 or more annually, plus a small additional sum, the latter for the purpose of taking care of the overhead expense in the management of the funds. In addition it is proposed that there be an endowment fund of \$1,000,000 00 or more, to be obtained from laymen as well as from medical men of sufficient means to make the endowment possible

When will the payment of the pension commence? It is suggested that it commence some time about the age of sixty to sixty-five. To physicians who are totally disabled before reaching that age, however, the payment of the pension will begin at the time of disability. It is thought that the recipient of the pension should continue to pay his annual subscription to the fund. In the beginning, it would not be feasible to apply the full pension, nor would this be possible for a number of years.

How would this pro rata amount be determined? It is proposed to require a membership of 30 years, in order to become eligible to the full pension of \$1,20000, so that any member who has reached the age of 60 years would be entitled to a pro rata portion of the full amount of the pension, if he had not contributed for the entire 30 years. For example, if a member had contributed for 15 years, he would be entitled to 15/30 of the amount, unless he would elect to postpone the time for the acceptance of his pension, say, until he is 65 years of age-in which event his pro rata portion would be 20/30 is to be hoped that every beginner in the practice of medicine will join this fund early, so that eventually every one will be the recipient in full of the pension

Who will administer this fund? A committee made up of officers or past officers of some of our leading medical bodies? The money is to be entrusted to a bank or trust company as a custodian account

Can the medical profession launch such a movement and maintain its existence, or should a lay body undertake this enterprise?

Before preparing this paper a number of doctors were consulted and, without any exception, they are most enthusiastic over the suggestion of undertaking it within the profession

One more thought Shall this be a local, state, or national organization?

Next Annual Meeting in Utica, June 3-6, 1929

For list of officers of County Medical Societies, see November 15 issue, advertising page xxv

MEDICAL CIVICS

How physicians may discharge their civic duties is discussed at every conference of officers of medical societies. It was considered at the Tri-State Conterence, which is reported on page 1437, and at the American Medical Association conference of State Secretaries and Editors, reported on page 1435

The medical societies of the state and counties of New York are among the leaders in dealing with the subject in a practical way

The practice of civic medicine or public health is co-relative with the private practice of medicine and its promotion is the object of the Public Relations Committee of the Medical Society of the State of New York whose last meeting is reported on page 1432 mittee plans to stimulate every county society to assume the leadership in the discharge of the civic duties which devolve upon physicians as a group called the medical profession

MEDICAL PHILOSOPHY

When two or three doctors get together informally, they philosophize and moralize on the subject of the practice of medicine, yet they are impatient when they have to listen to a formal subject on medical philosophy, probably because then they cannot talk back. Doctors are not noted for being good listeners

One day in the early fall, four persons sat in a hotel room and spent the morning talking about the philosophy of the practice of medicine. There were present an officer of the Medical Society of the State of New York, an official of the State Department of Health, a surgeon, and a lawyer who knew medical affairs, and this is what they said

The Health Official "Washington County was the scene of a controversy and dead-lock between the doctors and the lay health organizations until a physician was elected president of the County Tuberculosis and Public Health Association, and now public health work goes on smoothly with the lay organizations assisting the medical profession"

The Lawyer "The antagonistic attitude of the lay health organizations toward the doctors is founded on the reasons which are good, even if they are not sufficient. We lawyers are accustomed to consider both sides of a case in order to discover the plan of attack or defense of our opponent. In every dispute there are facts which support our opponents, and other facts which support our opponents, and there is a third group of facts which are basic, and would be conceded by both parties. If the disputants would sit down together and define their common facts, there would not be much left to dispute over

"Lay organizations are prone to act on insufficient facts, as for example when they insist on putting iodine in public water supplies in a section reputed to be goitrous. The advisability of that procedure is to be judged by the doctors only, and in such a matter as that there can be

The Surgeon "Suffolk County has shown the way how other county medical societies can obtain public opinion to support the policies of the medical profession."

may now other county medical societies can obtain public opinion to support the policies of the medical profession. The lay organizations recommend the necessity of creating public sentiment in favor of public health work, and they say, 'If doctors will not attempt public health work, we will stage a demonstration which will lead the public to assume the work at public expense,—and we can do it with our millions of endowment'"

The Health Official "Take the matter of county health officers Many rural counties are too small to need a county health officer A population of 150,000 would justify the formation of a county health unit, but a small county, such as Warren, could not support the kind of unit that is advocated by lay organizations. In

fact, Warren County already has a tuberculosis hospital, public health nursing, and sanitary inspection, and is doing pretty good public health work on county-wide basis, and so it does not need an extensive system"

The Lawver "Doctors are the persons best able to judge the health needs of a county, but how could the medical profession go about the task of ascertaining and estimating these needs? If a doctor were deputized by a county medical society to plan a system of public health work for your county, what would he do? Obviously the first thing to do would be to survey the county and take stock of the existing groups or organizations that are already doing public health work. Then he would make a list of projects in which additional work should be undertaken"

The Health Official "What the doctors want to do may not be what the lay workers want Doctors wish to confine their efforts to activities whose results are sure, but some laymen criticize the doctors for not rushing in to apply every new discovery indiscriminately, such as scarlet fever antitoxin, for example"

"Doctors are The Medical Society Officer slow to respond to demands which they are already able to supply Take periodical health Doctors send cases to hospitals examinations for examinations and laboratory tests which they can do themselves They encourage a drift of public sentiment toward clinics. State medicine is fostered by doctors as well as laymen Physicians should not need to take a course of instruction on how to make a periodical examination of a well person in distinction from a sick one Doctors need to be awakened to their opportunities in applying preventive medicine to well people"

The Surgeon "The awakening will come, not by forcible methods but by evolution The doctors of my city were opposed to public nurses, and said they would not let a nurse tell them what to do, but when a maternity nurse was employed, the doctors were very glad to have her provide sterile dressings and help in maternity cases The doctors now ask for the public health nurses and complain when they cannot get them No forcible means were adopted, but public health nursing came as a natural means of supplying a real need in the community"

The Lawyer "It was the same among lawyers who, 50 years ago, opposed examination and insurance of real estate titles, for they said the insurance companies would take away their law business, but now lawyers are the best patrons of title insurance companies"

The Health Official The lawyer can say whether or not a title is valid, for he has access to definite records The doctor cannot always tell whether or not a patient has tuberculosis"

The Surgeon "A doctor can make a scientific diagnosis in every case, if he will It is easy for a doctor to persuade patients to submit to complete examinations If periodic examinations were made, doctors would discover the premonitory signs and symptoms of cancer before the cancer has developed Talks to the public on the subject of cancer tend to make neurotics from fear of the disease, and to lead them to shun their doctors when they have a suggestive sign

of cancer Periodic examinations when little or nothing is said about cancer will prevent cancer much more effectively than popular talks on the suggestive signs of the disease. I will not give cancer talks or take an active part in an anticancer campaign, and as a result I have been accused of being an obstructionist. I do not believe that surgeons should remove a suspicious part and tell the patient that she is now protected against cancer."

LOOKING BACKWARD

This Journal Twenty-five Years Ago

Fee Splitting The first page of this Jour-NAL of December, 1903, contains two letters, the first of which could hardly be written today

"A physician, a member of our Association, was recently asked to see a patient in consultation by the latter's family physician, also a member of the Association. When the consultation was arranged for by the family physician, the consulting physician was requested to reduce his regular fee one-third.

"A few days after the consultation, the consulting physician received the following letter

"'Dear Doctor Should any inquisitive friends of the patient to whom you were called in consultation by me recently call on you to find out the condition of the patient, etc, please simply give them the facts of her disease, or condition, prognosis, etc, mentioning nothing about the fee, as I had to charge a little extra to cover my expenses, you may not be approached, but as country people do queer things, I mentioned this beforehand'

"To this the following reply was sent

"'You will probably remember that you requested me to reduce my fee one-third on account of the modest means of the patient's family, and I think you did wrong in adding

anything to the sum you paid me for my services to your patient, I think, however, that you should have charged for your own services under your own name'"

Euthanasia The same Journal has the fol-

lowing suggestion regarding euthanasia

"At the annual banquet of the New York State Medical Association on October 21st, one of the speakers was the Rev Merle St. Clair Wright, of the Lenox Avenue Unitarian Church In the course of his remarks he said

"I appreciate the practical difficulties in the way of the practical application of the doctrine, but it seems to me that it is not beyond the bounds of possibility Of course it would be necessary to have the advice and approval of men of the highest scientific attainment. The city might be divided into districts, and every application should be considered most carefully, not merely by physicians, but by some eminent clergymen selected for the purpose And, of course, there should be the consent of relatives and the consent, even the request, of the patient himself But where all these conditions are fulfilled, and where the prolongation of life is simply the prolongation of hopeless agony, it seems to me that it would be proper that such a patient should quietly, decently, modestly, be allowed to end the sufferings It seems that such a course would be a step forward in civilization and a step further away from barbarısm"

Take note that the suggestion was not made by a medical man. It would not have been made at all if the author had expected that he would have anything to do with the practical ap-

plication of his remarks

MEDICAL PROGRESS

Vitamin A as an Anti-Infective Agent.— H N Green and E Mellanby state that since the recognition of vitamin D (the antirachitic vitamin) as an entity distinct from vitamin A, those with experience in nutritional work have felt that to call vitamin A the "growth-promoting" vitamin is a misnomer, for good growth often takes place in its absence if the diet is otherwise complete. From the early days of its recognition it has been thought that vitamin A was concerned with resistance to infection, at least of a specific type The authors have made an extensive study with detailed post-mortem examinations of animals brought up on a vitamin A deficient diet was found that practically all the animals died with some infective or pyogenic lesions, while in the control animals receiving vitamin A these lesions were absent As regards the infective lesions that developed, xerophthalmia was not so common as might be expected, only 38 per cent. of the animals developing this lesion. In the 93 A-deficient animals examined the most characteristic condition was lack of adipose tissue and general visceral atrophy, but almost as prominent was the evidence of infection, only two animals of the 93 seeming to escape this Abscess at the base of the tongue was found in 72 per cent of the animals, infection of the urinary tract in 44 per cent, and pus in the nasal sinuses or in the middle ear in 20 per cent Infection of the alimentary tract was quite common, usually appearing as a terminal event. presence of vitamin D does not prevent the development of these morbid conditions writers feel that vitamin A plays an important part in conferring resistance to many types of infection, and suggest that infective and pyogenic conditions, even septicemia and acute rheumatism, be considered with relation to the vitamin A intake—British Medical Journal, October 20, 1928, 11, 3537

Practical Application of Vitamins—Erich Nassau of Berlin, first discusses the vitamin requirements of individuals which depend on the age, the season of the year, the state of nutrition, individual disposition, and special factors such as pregnancy, illness, etc. There is clearly a marked individual quotient by reason of which some subjects suffer privation while others of the same class escape, and at times we can notice this as a family peculiarity Age as a factor is shown for example in vitamin-A deficiency, for while the infant develops xerophthalmia the older subjects are attacked

by night blindness For the ocular troubles of the nursling cod liver oil is a sufficient Premature children are especially predisposed as are also the debilitated, while from March to May is the seasonal period of maximum development The author merely mentions in fine print the relationship of vitamin B to beriber, which is a purely exotic Vitamin C and its relationship to infantile scurvy and the treatment of the same with fresh fruit juices are trite subjects and the author adds but little to text-book information, but insists that there are types of anemia in childhood which benefit through the treatment of infantile scurvy even if the latter be not actually present. As to how far the new liver dietetic treatment owes its virtue to the presence of the C and other vitamins is as vet undecided The results of deprivation of vitamin D and its application in medicine are, of course, bound up with the causation and treatment of rickets, a subject which just at present is receiving plenty of attention The author is silent as to other vitamins Naturally vitamin E has as yet no medical uses, while vitamin X of some authors and its relation to pellagra is at the present time-as shown by the choice of the symbol "X"-an unknown quantity - Deutsche medizinische Wochenschrift, September 21, 1928

Treatment of Infection of the Urinary Tract -Knud Kelsted and E Schiot review the hitherto reported forms and results of acid therapy in infections of the urinary tract, and relate their experience with a series of 70 cases (28 cases of pyelitis and 42 of cystitis) In all cases the treatment consisted in the administration of calcium chloride or ammonium chloride with urinary disinfectants (hexamethylene tetramine, 1 gram three times a day, salol, I gram three times a day, or hexylresorcinol, 03 gram three times a day) calcium chloride and ammonium chloride the dosage was first 1 gram, then 2 grams, three times a day, and eventually 2 grams four times a day With this treatment 12 (171 per cent) of the 70 patients were cured, excluding the indwelling catheter cases 20 per cent were cured. In discussing the reasons for failure in such a large percentage of cases certain points are brought out Continuous treatment over a long period of time is necessary or six days of starvation may be of value in some cases Alternation of acid and alkali treatment should be tried in cases of pure colon bacillus infection without tendency to

calculus formation Other urinary disinfectants may bring some progress In some cases it is impossible to produce an acid urine since the quantity of ammonia produced is so great that it neutralizes the acid Further, the ammonia formed on cleavage of hexamethylene tetramine will also be instrumental in lowering the degree of acidity when this remedy is Perhaps the decomposition of leucocytes and epithelial cells may render the urine The bacterial growth counteracts the acid treatment Certain strains of bacteria are more resistant to acids than others. In the majority of cases in the authors' series large quantities of fluid were given. This may have been a mistake It would seem reasonable to combine the acid-disinfectant treatment with a restricted fluid intake -Acta Medica Scandinavica, September, 1928, lxix, 3-4

Sporadic Trichinosis in Mankind — G Adamy of Hamburg, associated with the medical clinic of the Hamburg-Eppendorf Hospital, announces that when the practitioner is confronted with the combination of fever and eosinophilia he must at once think of trichi-This is an old rule although there are usually plenty of other symptoms to go by, as initial diarrhea, tendency to edemas, especially of the eyelids, violent muscular pains, diazo-This picture is especially in reaction, etc evidence since the institution of compulsory meat inspection, and in the absence of the former epidemic incidence only sporadic cases are now likely to be encountered Meat inspection from its very nature cannot absolutely prevent the disease, for it is restricted to certain localities of the body It is true that some other diseases may at times present the combination of fever with eosinophilia but mistakes can hardly occur in the case of scarlet fever and some other maladies It is otherwise with polymyositis which, from its simulation of trichinosis, is called by some "pseudotrichinosis", but this is an excessively rare condition and in the few cases on record there have been no gastroenteric disturbances author has recently seen two cases of sporadic trichinosis, the first of which through the edematous manifestations closely simulated an acute nephritis, but the blood picture led to the correct diagnosis The other case simulated a sepsis thought due to thrombophlebitis, for the fever curve suggested the former while the swelling of the face suggested an erysipelas with associated phlebitis Negative bacteriological finds and the blood picture of trichinosis cleared up the situation—Munchener medizimsche Wochenschrift, September 14, 1928

The Virus of Yellow Fever—This subject was discussed in much detail by A Pettit and

G Stephanopoulo at a recent session of the Paris Academy of Medicine The authors were sent to Dakar by the French Government in October, 1927, to investigate the causation of a recrudescence of the disease in West Africa in 1926-7, with special reference to the spirochete discovered by Noguchi number of independent fellow workers they failed to find the Leptospira icteroides of Noguchi in the bodies of some of the victims of the disease and with numerous other workers they did find an organism which could not be distinguished from the Spirocheta acterohemorrhagica However, there is much evidence to-show that the two organisms are one and the same The authors experimented with a filtrable virus which is able to transmit the disease to monkeys and which they call the amaryllic virus, without any attempt to accuse any particular organism, the fact that the virus is filtrable naturally excludes the spirochetes from being the essential cause of the disease This was the original belief before Noguchi's discovery was announced The Macacus rhesus is the monkey peculiarly fitted for the study of the disease, and the liver of the infected animal contains the filtrable virus which may be preserved by freezing. In addition to emulsions of liver and spleen it is also present in whole blood and blood serum. By means of the virus a disease apparently identical with yellow fever may be produced in Macacus rhesus and other monkey species By means of this virus as antigen animals not susceptible to it can be made to yield an antitoxin does not seem to have been decided whether this substance is of value in the prevention and treatment of the disease in mankind Convalescent serum from a man sufficed to prevent the development of the experimental disease in a monkey and a similar result was attained by the use of an anatoxin—Bulletin de l'Academie de Medecine, October 2, 1928

Treatment of Ascites -In an article on the pathogenesis of ascites P Iversen of Copenhagen has the following to say under the head of treatment which must be very largely If the condition is due to cirrhosis the circulation in the liver must be altered for the better The so-called Talma operation, otherwise known as omentopexy, has largely been abandoned because of unfavorable re-More rational would appear to be the reduction of the amount of blood which passes through the liver Eppinger suggested that this might be done by splenectomy—that is, if the spleen is hypertrophic-but he does not show that this operation actually diminishes the blood supplied to the liver However, certain measurements made by Lassen seem to prove that the amount of blood is reduced

25 per cent by splenectomy The author sees no necessity to wait for hypertrophy of the spleen before operating, for he would test the theory by removing the normal spleen as a disburdening of 25 per cent may be sufficient to prevent or remove ascites If no radical operation is undertaken the subject of puncture must come up and the question is when to puncture If one waits until the last moment the organism may be forced to make better anastomoses than if one punctures early At the same time early and systematically repeated punctures have been used, although without benefit. In these cases there is some danger of fatal hemorrhage from rupture of an esophageal varive. If the liver is the subject of stasis of cardiac origin, heart tonics may give good results. In all cases a saltpoor diet and diuretics are good adjuvants --Klimsche Wochenschrift, October 14, 1928

The Effect of Strain on the Heart -After describing the mechanism of heart failure, Paul D White discusses the intrinsic and extrinsic factors concerned in producing heart The intrinsic factors are the various types of valvular disease, congenital defects, pericarditis, my ocardial disease, and diseases of the great vessels In recent times the myocardium has been regarded as of paramount importance and fully able to compensate for the valvular defects. It is now appreciated that no matter how good the heart muscle may be, it may fail under the burden of long continued valvular disease The extrinsic factors, with the exception of hypertension and hyperthyroidism, are of far less importance than the intrinsic factors Under proper conditions the most strenuous exertion is well borne by the healthy heart There is still some doubt as to the heart becoming enlarged as the result of exercise The so-called athletic heart and cardiac disease attributed to military service usually belong to the effort syndrome While exercise must be prescribed with care for persons with heart disease, if the heart is competent a little exercise is probably beneficial Accidents do not produce special heart strain unless they affect the heart directly by injury When heart disease is found after accidents it has almost invariably been present before, but not recognized should be possible for the accident hoard to grade compensation according to the responsibility of the accident, as is the law in Kentucky, and not as in most States, to consider it wholly or not at all responsible normal heart pregnancy, obesity, and overeating are not strains Infectious diseases do not impose any particular burden on the heart, unless they actually cause heart disease, as do serious rheumatic disease and diphtheria

The routine administration of digitalis in an infectious disease, therefore, appears unwar-Even in pneumonia it may be wisest ranted to withhold cardiac stimulation unless it is obviously needed. Diseases of other organs may cause heart strain, usually, but of slight degree Anemia and nutritional diseases impose quite a severe burden. Altitudes of less than 10,000 feet place a relatively slight tax on the healthy heart. Anesthesia and surgical operations exert a variable strain, but less apparently on the heart than on the nervous control of the circulation. The custom of forcing the intake of fluids imposes an undue cardiac burden and may lead to congestive There is little evidence that alcohol, tobacco and coffee produce any deleterious effects on the healthy heart except transiently as irritants, save when alcohol taken in excess everts a toxic effect. Nervous (mental and emotional) strain, in the present era, is doubtless more of a factor than ever before—New England Journal of Medicine, October 25, 1928, cycix, 17

Spontaneous Gangrene in the Limbs of Other Than Aged Subjects —Dr Max Grasmann refers to the obscurity which still exists in some of the aspects of this affection Traumatic, arteriosclerotic, and diabetic forms are simple enough, but in many cases there is a lack of type and even the mechanism of embolism and thrombosis may be absent author comments at some length on the condition known as thromboangitis obliterans which has been described at length in Leo Buerger's monograph This has now become well known throughout the world and occurs frequently in all countries, although under a variety of names The author relates a personal case which occurred in a man of 34, an age relatively young for this affection was a history of syphilis (Wassermann now negative), of abuse of nicotine and of abdominay typhus, but on the first outbreak of the present condition he was seemingly in good health Extremely severe pains in the lower limbs were accompanied by pale and cold skin and other evidence of interrupted circulation The pains were so violent as to cause collapse Gangrene then appeared about the toes on the left side and an amputation was performed above the condyles. The patient also had severe abdominal crises and latterly the symptoms appeared in the left upper extremity, and gangrene set in in the right lower extremity followed by another amputation with death trom post-operative pneumonia. As autopsy was refused the only documents were those furnished by the amputated limbs. The arteries were found in perfect condition without any trace of either thrombosis or embolism

calculus formation Other urmary disinfectants may bring some progress In some cases it is impossible to produce an acid urine since the quantity of ammonia produced is so great that it neutralizes the acid Further, the ammonia formed on cleavage of hexamethylene tetramine will also be instrumental in lowering the degree of acidity when this remedy is given Perhaps the decomposition of leucocytes and epithelial cells may render the urine less acid The bacterial growth counteracts the acid treatment Certain strains of bacteria are more resistant to acids than others. In the majority of cases in the authors' series large quantities of fluid were given. This may have It would seem reasonable to been a mistake combine the acid-disinfectant treatment with a restricted fluid intake -Acta Medica Scandinavica, September, 1928, lxix, 3-4

Sporadic Trichinosis in Mankind - G Adamy of Hamburg, associated with the medical clinic of the Hamburg-Eppendorf Hospital, announces that when the practitioner is confronted with the combination of fever and eosinophilia he must at once think of trichinosis This is an old rule although there are usually plenty of other symptoms to go by, as initial diarrhea, tendency to edemas, especially of the eyelids, violent muscular pains, diazo-This picture is especially in reaction, etc evidence since the institution of compulsory meat inspection, and in the absence of the former epidemic incidence only sporadic cases are now likely to be encountered Meat inspection from its very nature cannot absolutely prevent the disease, for it is restricted to certain localities of the body It is true that some other diseases may at times present the combination of fever with eosinophilia but mistakes can hardly occur in the case of scarlet fever and some other maladies It is otherwise with polymyositis which, from its simulation of trichinosis, is called by some "pseudotrichinosis", but this is an excessively rare condition and in the few cases on record there have been no gastroenteric disturbances author has recently seen two cases of sporadic trichinosis, the first of which through the edematous manifestations closely simulated an acute nephritis, but the blood picture led to the correct diagnosis The other case simulated a sepsis thought due to thrombophlebitis, for the fever curve suggested the former while the swelling of the face suggested an erysipelas with associated phlebitis. Negative bacteriological finds and the blood picture of trichmosis cleared up the situation -Munchener medizinische Wochenschrift, September 14, 1928

The Virus of Yellow Fever—This subject was discussed in much detail by A Pettit and

G Stephanopoulo at a recent session of the Paris Academy of Medicine The authors were sent to Dakar by the French Government in October, 1927, to investigate the causation of a recrudescence of the disease in West Africa in 1926-7, with special reference to the spirochete discovered by Noguchi number of independent fellow workers they failed to find the Leptospira icteroides of Noguchi in the bodies of some of the victims of the disease and with numerous other workers they did find an organism which could not be distinguished from the Spirocheta icterohemorrhagica However, there is much evidence to-show that the two organisms are one and the same The authors experimented with a filtrable virus which is able to transmit the disease to monkeys and which they call the amaryllic virus, without any attempt to accuse any particular organism, the fact that the virus is filtrable naturally excludes the spirochetes from being the essential cause of the disease This was the original belief before Noguchi's discovery was announced The Macacus rhcsus is the monkey peculiarly fitted for the study of the disease, and the liver of the infected animal contains the filtrable virus which may be preserved by freezing. In addition to emulsions of liver and spleen it is also present in whole blood and blood serum. By means of the virus a disease apparently identical with yellow fever may be produced in Macacus rhesus and other monkey species By means of this virus as antigen animals not susceptible to it can be made to yield an antitoxin does not seem to have been decided whether this substance is of value in the prevention and treatment of the disease in mankind escent serum from a man sufficed to prevent the development of the experimental disease in a monkey and a similar result was attained by the use of an anatoxin—Bulletin de l'Academie de Médecine, October 2, 1928

Treatment of Ascites—In an article on the pathogenesis of ascites P Iversen of Copenhagen has the following to say under the head of treatment which must be very largely causal. If the condition is due to cirrhosis the circulation in the liver must be altered for the better. The so-called Talma operation, otherwise known as omentopexy, has largely been abandoned because of unfavorable results. More rational would appear to be the reduction of the amount of blood which passes through the liver. Eppinger suggested that this might be done by splenectomy—that is, if the spleen is hypertrophic—but he does not show that this operation actually diminishes the blood supplied to the liver. However certain measurements made by Lassen seem to prove that the amount of blood is reduced

By LLOYD PAUL STRYKER, ESQ Counsel, Medical Society of the State of New York

THE APPLIED ART OF PSYCHOLOGY AND THE LAWS OF THE STATE OF NEW YORK*

THIS is a large topic to compress within the fifteen minutes which have been assigned me. It will be possible to treat it only in the barest outline. At the outset I would emphasize that in what I here say I am speaking solely for myself alone, and not for any clients whom I serve

You will, I am sure, acquit me of any affectation of a learning which I do not possess when I remind you that the word "psychology" is de-rived from two Greek words, "xoxy" meaning the mind or soul, and " xoyos " a theory Psychology has been defined as "The science of mind or of mental states and processes, mental science, the science which treats the analysis, laws of connection, and conditions of mental phenomena"1 The consideration of this subject would seem to contraindicate the need for any excursion into ancient history, as everyone knows that psychology is said to have originated with Pythagoras, and that Aristotle worked out a fairly complete psychological system, an important principle of which was the association of ideas

The wide-spread present day interest in psychology is no doubt due to Sigmund Freud, whose Studien über Histerie appeared in 1895 This work expounded a new treatment, the socalled catharsis which consisted of putting the patient in a hypnotic state, and the examination by the physician while under this condition of the forgotten original circumstances under which the symptoms first appeared Somewhat later Freud blazed out a new trail of his own, and abandoning hypnosis developed a technique in the socalled psycho-analytic method under which the pathogenic material of which the patient was unconscious was revealed by means of free association and by the interpretation of dreams Freud heavily stressed the relation of sex to psychology His works aroused interest not only among physicians and psychologists, but attracted the enthusiastic attention of the lay public throughout the world

"Everyone," says Professor H L Hollingworth in his Applied Psychology, "is familiar with the great increase in the popularity of psychology within recent years. The number of books on psychological topics, the number of so called psychological plays, of reference to psy-

chology in the newspapers and magazines, of efficiency bureaus and similar enterprises in the business world, all indicate remarkable changes in the status of psychology "2"

No aspiring novelist or dramatist of today would think of producing a novel or a play unless it were plentifully sprinkled with much of the familiar patter of popular psychology. Behaviorism, reaction patterns, psychological patterns, complexes, disassociation, catharsis, dualism, neuro dynamic inhibitions, auto suggestion, nerve elements, aneurism, neurasthenia, hysteria, psychopathology, the unconscious mind, repression, sex instincts and their motivations, ego instincts, auto-erotism, and Heaven knows what else, are now a part of the vernacular of every newspaper and magazine reader and theatergoer

To this loud babel of sound, there are added the voices of many who rush in where angels, and perhaps scientists, might fear to tread "Psychoanalysis," says Dr John T MacCurdy in his Problems in Dynamic Psychology, "has become highly popular as a result of its therapeutic achievements on the one hand, and also, probably, because its insistence on one dominating and specific unconscious tendency, namely the sexual, has made a wide and often morbid appeal" 3

"The question as to what this system really is," he continues, "has become each year more pressing while a number of factors have contributed to obscure the problem Four of them are important The first is that psychoanalysis has never been formally taught but has been learned in the main by independent observations of men originally inspired by the scattered and unconnected writings of Freud and his immediate followers * * * Theoretically, psychoanalysis aims at an investigation of the patient's entire life, a task which is practically impossible of comple-Consequently the analyst must make a selection, and this is apt to be made on a basis of personal bias, the analyst selecting those mental trends for special investigation which are likely to strengthen his particular hypothesis * * * Unquestionably patients do find relief, particularly at the beginning of an analysis, simply from the conviction that the treatment is potent to charm away their symptoms. This should rightly be termed suggestive influence and psychoanalysts have no hesitancy in so naming it But permanent cure, they claim, does not con-

^{*} Pead before the Society of Medical Iurisprudence, New York Academy of Medicine October 8, 1928

They were, however, under-developed with small caliber and thin walls. Nothing but functional causal elements such as angiospasm could be postulated—Munchener medizinische Wochenschrift, September 28, 1928

The Chemistry of Senile Tissues—Prof M Burger and Dr G Schlomka have given intensive study to this subject and have arrived at long and somewhat diffuse conclusions Two basic concepts must be isolated The first deals with the individual organs or organsystems, the bloodvessels being first thought of in this connection The second refers the changes to some dominating factor in the nervous system or gonads According to the first concept the organs all grow old together, although naturally changes in the bloodvessels must be followed by various secondary changes in the individual organs The second concept in the case of certain incretory glands gives some hope of checking old age by grafting Two terms are used to distinguish these two concepts. If all the organs age together the condition is one of synchronia, and if one organ or system can age precociously the corresponding term is heterochronia. The authors have sought to determine the physiological decadence of individual organs by various tests, including chemical analysis. Thus in the aorta there is a progressive accumulation of cholesterin from zero at birth to 1123 mgms in the period 60-80 years. Other structures were examined, each having its special criterion While there is normally a close harmony in the ageing of organs, heterochronia may exceptionally be in evidence. The mere fact that the tissues tend to dry out uniformly shows that from the angle of physiology alone, synchronia is the norm Heterochronia is pathological—Klinische Wochenschrift, October 7, 1928

Palm Color Test.-W W Duke, writing in the Archives of Internal Medicine, October, 1928, xlii, 4, describes a simple and practical clinical method for the diagnosis of anemia and plethora Laboratory methods have certain shortcomings, are open to error in interpretation, and often are not available to the general The color of the palm of the hand is influenced by few conditions except anemia and plethora By comparing the patient's hand with that of a normal person, one can demonstrate slight deviations from the optimum in the quanto wof hemoglobin in the general circulation. In making the comparison the patient and the normal person should either stand or sit comfortably The hand of each should be semi-flexed at about the level of the apex of the heart or a little above for a few moments, until constant permanent color has been established. It is essential that the

distance between the hand and the base of the heart be identical in both the patient and the normal person (the physician himself, if his palm is normal in color), and that in neither should the skin of the palm be stretched Certain red and white spots, should they appear, can be eliminated if both the hand of the patient and that of the control are held at a slightly higher level If the patient is slightly anemic his hand will be paler than that of the normal person, if he is plethoric the abnormal redness will be so marked that it could not possibly be overlooked tions which may interfere with the test are marked cyanosis or jaundice, Renaud's and other diseases of the arteries or veins, skin diseases and chilblains The test is not accurate in patients whose hands have been scalded or kept in hot water a great deal, in a few patients with goiter and in rather obese persons over middle age, whose hands often show more color than usual, and also in cases The test is not applicof syncope or shock able in pernicious anemia, as this condition gives rise to an unusually rosy color in the superficial tissues, even when the capillary red count is reduced by one or two million or more Keeping in mind these exceptions, the physician will find the palm test a simple, accurate, and direct method of examination which can be used fearlessly in diagnosis. After blood transfusion and during and after venous section the test is a most reliable guide in deciding whether or not an adequate amount of blood has been introduced or withdrawn

Furuncle and Carbuncle —H Heinlein is impressed with the fact that these lesions cannot be treated by single formulae and that treatment must be individualized Sometimes he has aborted beginning furuncles with a drop of carbolic acid Good results have been seen in the individual case from the Bier-Klapp method, phototherapy, radiotherapy, autohemotherapy, autovaccine, Besredka's antivirus, etc In the case of dangerous furuncles on the lips, cheeks, etc, expectant treatment is indicated only at the outset and for a brief period After that we must excise-never incise, and the author believes that the radical elliptic incision is a sure life-saving precaution which should give 100 per cent recovery treatment of carbuncle the same kind of in-Riedel practised dividualization is necessary radical excision as far back as 1883 and recom The author mended it to the world in 1891 has made use of it for many years in cases not too far advanced and in localities which permit it, with uniform success The scars from the granulation process are large but relatively smooth and not very disfiguring -Münchener medizinische Wochenschrift, October 5, 1928

pretend to apply a science of which they are ignorant, or of which they have but a vague smattering, may work injury to their patients

The public policy of this and other enlightened States and Nations, has long recognized the need of protecting the public against the claims of incompetent pretenders Thus, for decades it has been unlawful for anyone to practice law or medicine until the State has approved of his qualifications by a proper system of examination and licensure This principle has been carried into innumerable other avenues, thus, no one can be a dentist or a pharmacist, or an optometrist, or a chiropodist, without passing an examination and having his qualifications certified by the State Even a chauffeur must now be licensed. Indeed under our present Statutes the owner of his own car is forbidden to drive until he has demonstrated his capacity to do so without injuring others, and has received his driver's license This is sound, sensible, wise and in further ance of the public welfare

From reliable official sources I am informed that there are in this City, a number of socalled "Psychologists', who practice "Applied Psychology", and who in this connection solicit, and for pay accept, patients whom they advise in regard to their mental and emotional equilibrium, and their mental derangements, and who have and maintain offices in the City for that purpose Some of these I am told, are careful to limit their work so as to exclude any advice with regard to "physical conditions" others, I understand, are not so careful in that respect None of those to whom I now refer are licensed to practice medicine in this State Some of them appear to have graduated from first class institutions of learning, while the academic background of others is more sketchy Some of these men appear to possess a good knowledge of the science of psychol-Some have published books, some, no doubt, are sincere in their belief that they are of real service to mankind, others it is probable, are actuated by the ordinary motives of the quack Do these so called psychologists, who are not licensed to practice medicine, but who engage in the practice of so called applied psichology, violate the Laws of this State?

The law which they violate, if any, is that which forbids a person to practice medicine without a license, and makes such practicing a crime. To the layman who associates the practice of medicine with surgery, or the giving of pills, it would probably seem far fetched to consider the practice of applied psychology as the practice of medicine. But I am concerned here with legal definitions. What the practice of medicine is in this State has been carefully defined for us by Statute as follows. "A person practices medicine * * * who holds

himself out as being able to diagnose, treat, operate or prescribe for any human disease, pain, injury, deformity or physical condition, and who shall either offer or undertake by any means or method, to diagnose, treat operate or prescribe for any human disease, pain, injury, deformity or physical condition "10"

An analysis of the definition reveals two main elements (a) the holding out as being able to diagnose, etc and (b) the actual offering or undertaking to do so Both elements must be present. The practice of medicine has been judicially defined as not consisting merely in the administration of drugs or the use of surgical instruments Thus in the Allcutt case the defendant who was not licensed to practice medicine, advertised that he was practicing Mechano Neural Therapy He took patients, made diagnoses, prescribed diet and conduct. and received pay for his consultations and It was held that he was guilty of practicing medicine without a license, despite the fact that he neither gave nor applied drugs or medicines, nor used surgical instru-The Appellate Division said "To confine the definition of the words 'practice medicine' to the mere administration of drugs or the use of surgical instruments, would be to eliminate the very cornerstone of successful medical practice, namely, the diagnosis would rule out of the profession those great physicians whose work is confined to consultation, the diagnosticians, who leave to others the details of practice "11 The defendant's conviction was affirmed 12

That branch of fraud and quackery embraced in the so called practice of chiropractics, with one voice has been condemned by the Courts. A chiropractor who is not licensed to practice medicine but who plies his unlawful calling is a criminal 18

Let us here, however, note that the law prohibiting the unlicensed practice of medicine contains one important exception, it does not prohibit "the practice of the religious tenets of any church" Thus, in the case of People Cole, the defendant was not a licensed physician but a practitioner of the Christian Science Church He assumed by silent prayer and for a money consideration, to practice the healing art upon a patient who was troubled with an infection in his eyes, and pain in the back He made no diagnosis and prescribed no remedy He was convicted but the Court of Ap peals set aside his conviction by reason of the e ception just referred to But the Court said "The religious tenets of a church must however, be practiced in good faith to come within the exception When such practice is a fraud or pretense it is not excepted from the general prohibition When wrong is practiced in the name of religion it is not protected by consti1428 LEGAL

sist in loss of symptoms alone but in such a reorganization of the patient's mental life, as to make the unconscious forces, which motivated the symptoms, actually productive of happiness and efficiency. In other words, cure rests not on an abolition of symptoms such as suggestion may affect, but on a redirection of unconscious strivings which suggestion does not attempt to produce and which, in fact, occurs spontaneously. This is the ideal. In practice it is probable that with host of incompetents who advertise 'psychoanalysis' as their mode of treatment there are many patients who receive under this title nothing but suggestion—and clumsy suggestion at that "5"

"Psychoanalysis," says A A Brill, "has attracted many charlatans and quacks who find in it a medium for the exploitation of the ignorant classes by promising to cure all their ailments by psychoanalysis This, as everyone knows, is nothing new in medicine, there is no disease which is not cured by quacks. One could therefore easily remain silent and think that any person who is foolish enough to entrust his mind to quacks deserves no consideration, but as I feel somewhat responsible for psychoanalysis in this country, I merely wish to say that, whereas psychoanalysis is as wonderful a discovery in mental science as, let us say, the X-ray in surgery, it can be utilized only by persons who have been trained in anatomy and pathology As a therapeutic agent psychoanalysis at best has a very limited field, it can only be used in the treatment of special cases It cannot cure cancer, it cannot make an adjustable citizen out of a defective 'radical,' it cannot return an arrant young husband to a neurotic elderly lady, it has no more to do with the separation of mismated couples than the miscroscope with the dissolutions of In fine it cannot make a normal person out of an idiot, and does not give a philosophy of life to a person who has not brains enough to formulate one himself But it has already rewritten all the mental sciences, and in the hands of trained psychiatrists it can cure the most chronic psychoneurotic affections "6

It may be well here to recall and to emphasize that Sigmund Freud was a doctor. He was a student of medicine and of the mind. But even his doctrines have been subjected to critical analysis. No better criticism has come to our attention than that of Dr. John MacCurdy. "In 1913 and 1914," he writes, "Dr. Hoch and I spent some hundreds of hours together in reading critically what Freud had written. To our surprise it was found that his fundamental principles were not internally consistent."

I am attempting no personal appraisal of Freudian doctrines Such an effort would be outside the field of this paper, and far beyond my own capacity I go no further than to assert that all of these subjects belong to medical

science They deal with the study of the mind The mind is a part of the human body human body in all its parts and functions is the domain and the proper province of the physician Certainly is this true with respect to any diagnosis, treatment or prescription. Nor is this any the less true because many important contributions have been made to the subject by nonmedical men The relation of psychotherapy to medicine has been stressed by Dr Eric McNam-He speaks of psychotherapy as a "modern branch of medicine" "The frequent apparent absence," he declares, "of adequate physical factors in the causation of many functional nervous and mental diseases, the dualism which distinguishes between the spheres of action of mind and body, and the apparent potency of the psychic activities of one person directed upon the mental state of another, combine to justify the practice of psychotherapeutics Nevertheless, even with a proper respect for most recent developments, it is still difficult to be sure as to which is the most successful method, or whether a combination of physico- and psycho-therapeutics may not be better than either alone. It is strange to note how exceedingly exclusive the methods of therapy are apt to be Those who perform miracles or heal by processes such as those of Christian Science claim no technical skill in medical diagnosis or any regard for it, but variation in treatment according to variation in diagnosis or at least according to the various aetiological factors discovered might be expected from the scientifically trained Nevertheless, too frequently, the persuasionist, the hypnotist, or the analyst apply their methods, much in the way that their precursors of long ago applied their nostra, with entire lack of discrimination"8

Psychoanalysis, psychiatry, psychotherapy, and applied psychology, are all related, in that, in one way or another, they treat of mental abnormality. The subject of my paper is "The Applied Art of Psychology and the Laws of the State of New York" "Applied Psychology" has been defined by Professor Hollingworth as "The application of the findings of psychology, the affairs of daily life"

The word "applied" means, "put on, directed or employed" When used in connection with a science it means, "that the laws of the science in connection with which it is used are employed and exemplified in dealing with concrete phenomena, and in this use the word applied is distinguished from abstract or theoretical, as for example, applied chemistry, applied mathematics, etc "0"

The applied art of psychology means, the employment of the science of the mind, or of mental states and processes, in dealing with concrete human minds. Those who employ or apply a science, should be learned in that science. Those who are not learned in, but who nevertheless

mind which science does not yet understand But those who ought to understand both the body and the mind better than all others, are the men who through a long course of study, and proven qualifications, are authorized by the State to practice medicine

"The power of the State," said the United States Supreme Court, "to provide for the general welfare of its people, authorizes it to prescribe all such regulations as in its judgment will secure or tend to secure them against the consequences of ignorance and incapacity, as well as of deception and fraud means to this end it has been the practice of different States, from time immemorial, to exact in many pursuits a certain degree of skill and learning upon which the community may confidently rely, their possession being generally ascertained upon an examination of parties by competent persons, or inferred from a certificate to them in the form of a diploma or license from an institution established for instruction on the subjects, scientific and otherwise, with which such pursuits have to deal The nature and extent of the qualifications required must depend primarily upon the judgment of the State as to their necessity If they are appropriate to the calling or profession, and attainable by reasonable study or application, no objection to their validity can be raised because of their stringency or difficulty * * * Few professions require more careful preparation by one who seeks to enter it than that of medicine It has to deal with all those subtle and mysterious influences upon which health and life depend, and requires not only a knowledge of the properties of vegetable and mineral substances, but of the human body in all its complicated parts, and their relation to each other, as well as their influence upon the mind The physician must be able to detect readily the presence of disease and prescribe appropriate remedies for its removal Everyone may have occasion to consult him, but comparatively few can judge of the qualifications of learning and skill which he possesses Reliance must be placed upon the assurance given by his license, issued by an authority competent to judge in that respect, that he possesses the requisite qualifications

Due consideration therefore, for the protection of society may well induce the State to exclude from practice those who have not such a license, or who are found upon examination not to be fully qualified * ** No one has a right to practice medicine without having the necessary qualifications of learning and skill, and the Statute only requires that whoever assumes by offering to the community his services as a physician that he possesses such learning and skill, shall present evidence of it by a certificate or license from a body designated by the State as competent to judge of his qualifications "18

I believe that there has been no adjudication of the Courts as to whether or not a person practicing applied psychology is practicing medicine within the statutory definition. Until such decision has been made no one can predict what it will be No doubt the Courts will decide the question upon the basis of the particular facts presented in each particular case which may arise. If in such a case it is found that the applied psychologist is in fact diagnosing, treating or prescribing for a physical condition, and is not licensed to practice medicine, he will be convicted of a crime

tution or statute", and further that it was a question for the jury "Whether the defendant was in good faith practicing the tenets of such a church within the meaning of statutory exception" 15

This exception is not directly germane to our discussion, as the "Applied psychologists" so far as I am aware, do not claim to practice "The tenets of a church" One of these practitioners however, points to his studies in several theological schools as an evidence of his qualifications A person who practices applied psychology by definition, is dealing necessarily with the conditions of mental phenomena it is his purpose to readjust the mental and emotional equilibrium of the mentally sick, he must necessarily make a study of their condition and determine what it is To do this requires diagnosis Diagnosis is "The recognition of a disease from its symptoms "16 Having made his diagnosis the applied psychologist might be said to undertake to "freat" his patient Certainly he prescribes for him if he tells him what to do The Century Dictionary defines "prescribe" as meaning to "advise* * a remedy for disease", and quotes these three lines from Shakespeare's Richard II

"Wrath-kindled gentlemen, be ruled by me, Let's purge this choler without letting blood,

This, we prescribe, though no physician "17

The question might still be asked as to whether or not the emotional or mental condition of a patient falls within the statutory definition of a "human disease, pain, injury, deformity, or physical condition" Inasmuch as the mind is a part of the body, it would seem that any disturbance in the proper functioning of the mind is a disturbance of a "physical condition" The precise nature of the diagnosis, treatment or prescription is unimportant, because the statute prohibits an unlicensed man from doing these things "by any means or method"

An able and loyal member of the medical profession of this State has written me that "there is no doubt that a number of these psychologists are practicing medicine, and particularly psychiatry illegally, and that their activities constitute a violation of the medical practice act", but he continues, "I personally am inclined to believe that many non-medical individuals have a legal right to carry on work which some medical men might regard as the practice of medicine" I should pause here, to observe that what I am endeavoring to consider is not what "some medical men might regard as the practice of medicine" but how the Courts might regard it

The letter previously quoted from continues, "I think two points should be considered First, speaking by and large, the average physician

is woefully ignorant in the fundamentals of psychology and psychiatry Second, the greatest recent advances in psychiatry have come from the psychology which has been developed largely by non-medical men" As to the knowledge or ignorance of the average physician in the fundamentals of psychology and psychiatry, I consider myself unable to entertain or to express a competent opinion. But the fact that recent advances in psychiatry have come from psychology developed by non-medical men, would not to my mind constitute a valid reason for permitting those who are not licensed physicians to practice applied psychology, if such practice may be deemed to fall within the definition of the practice of medicine

In this same letter my informant says "What I wish to indicate is that I doubt, for example, whether the 'human diseases, pain, injury, deformity, or physical condition' of the medical practice act can properly include the multitudinous educational and social maladaptations with which most practicing physicians so madequately deal" This is the statement of a wise and sane member of the medical profession As to this I again express my inability to form or express a competent opinion But if practicing physicians do inadequately deal with these maladaptations, it would seem to me that the remedy lies in better education of physicians in the field of psychology rather than permit unsponsored men to do the work

From my limited reading of the various writers upon the subject of psychology, I would gather that in the past few years, especially, there has been a vast growth of learning on this subject, and that there is as yet no unanimity as to proper deductions to be derived from this new knowledge. theories are constantly advanced and either The behaviorists' criticized or disproven school, for example, has its protagonists and its critics. Some psychologists apparently view psychoanalysis with more approval than Accepted scientific deductions no others doubt will come In the meanwhile, is it wise to permit self-styled psychologists to hold themselves out as capable of treating mental disturbances of whatever kind they may be? If psychology is to be regarded as a separate and special field, distinct from medicine, then it seems to me that the legislature should take recognition of this fact and provide for the examination and licensure of "psychologists" But I would consider such a plan unnecessary and unwise To my mind it would be wiser to leave to the medical profession the diagnosis, treatment and prescription for all disorders of If they do this inadequately now, that is a matter which can be corrected in the future in the curricula of the medical schools

There is much both of the body and the

DUTIES OF COUNTY PUBLIC RELATIONS COMMITTEES

The following five duties and functions of the Public Relations Committee of a county medical society were adopted by the Committee on Public Relations of the Medical Society of the State of New York on June 17, 1927, approved on the same day at a joint meeting of the committee with a similar committee of the State Charities Aid Association, and printed in this Journal of July 15, 1927, page 797 These five functions were again approved by the Committee on Public Relations at its meeting on July 7, 1928, and were printed in this Journal of August 15, 1928, page 1009

The Five Functions

- 1 Make a complete survey of health agencies in the county, noting the names, membership, program and manner of carrying on their work.
- 2 Collect data concerning all types of medical activities, both curative and preventive, and whether promoted by official or unofficial agencies
- 3 Confer with director or proper committee of every agency or organization interested in conducting or promoting curative and pre-
- ventive medical activities in the county, with regard to its program, for the purpose of offering assistance in the development of the medical phase of such program
- 4 Confer frequently with the public health committee of the County Society regarding the methods employed in public health work throughout the county
- 5 Be prepared to take leadership in developing medical programs of county agencies

THE RELATION OF PHYSICIANS TO VOLUNTARY HEALTH AGENCIES

The following eight principles were formulated at the joint conferences held between February 16 and March 9, 1928, by representatives of the Medical Society of the State of New York, the Cattaraugus County Medical Society, and the State Charities Aid Associa-

tion and the Milbank Fund, adopted by the House of Delegates of the Medical Society of the State of New York on May 21, 1928, and printed in this Journal on May 1, 1928, page 495 They were again printed in this Journal of July 1, page 803

The Eight Principles

- 1 The essential part of public health work being preventive medicine, there should be no failure on the part of official and unofficial health and welfare organizations to recognize the importance of the local practicing physician
- 2 All those associated in the conduct of public health activities must recognize fully that preventive medicine is the doctor's rightful field and that laymen must at all times look to the medical man for guidance and leadership therein
- 3 Public health work within a county involves three participating factors, lay organizations, official governmental agencies, and the members of the county medical profession
- 4 The evolution of a county health program should be the evolution of medical forces within the county. It is not only the duty but the prerogative of the local physicians to assume leadership in the organization.
- 5 The function of lay organizations and employees of the county health organizations, acting under the leadership of the practicing physicians of the county, includes assistance in

- educational work, in helping those who are unable to carry out the doctor's advice, and in providing means whereby the public health program may be carried out
- 6 Lay organizations are needed in the county Their cooperation is to be welcomed by the physicians. They are needed for the great educational work they can do, for their influence on public opinion, legislation and laws, and in many other ways. But preventive medicine must be controlled and guided by the medical men of the county
- 7 As the function of the county health officer is not to exercise the function of the physicians of the county but to explain the facilities and stimulate the use of these facilities by the citizens, therefore, before any innovations are put into effect by a demonstration or other agency, they should first be thoroughly studied and discussed by the medical society and the professional membership of the county board of health
- 8 All local publicity should be of fact and simply to inform the people of the county of public health work which is being done, why it is being done, and why it should be done

NEWS NOTES

PUBLIC RELATIONS COMMITTEE

A meeting of the Committee on Public Relations of the Medical Society of the State of New York was held in the Transportation Club, Hotel Biltmore, New York, on November 9, 1928, with all the members present,—Dr James E Sadlier, of Poughkeepsie, Chairman, Dr W H Ross, of Brentwood, Secretary, Dr A J Hambrook, Troy, Dr O H W Mitchell, Syracuse, and Dr W D Johnson, Batavia There were also present Dr Harry R Trick, Buffalo, President of the Medical Society of the State of New York, Dr E A Vander Veer, President elect, Dr J S Lawrence, Executive Officer, Dr Frank Overton, Executive Editor, and Dr Thomas P Farmer, Syracuse, Chairman of the Committee on Public Health and Medical Education

Dr Sadlier presented each member with a typewritten outline of the subjects to come before the meeting

Dr Ross presented a written outline of a plan for making a survey of each county with special reference to the lay health organizations in the county. This communication was printed as an editorial on page 1363 of the November 15 issue of this Journal. On motion the plan of the survey was adopted.

BASIC MAP FROM THE AMERICAN MAP COMPANY, NEW

Outline of districts of the members of the Committee on Public Relations

Dr Ross also presented a survey of Suffolk County as a concrete example of the descriptive, as distinguished from the statistical, method for making the surveys. This is printed as survey number one on page 1433 of this JOURNAL

The committee then allocated the counties among its members according to the accompanying map, and each committeeman was instructed to stimulate each county society in his district to appoint a Public Relations Committee whose first duty should be to make a survey of the organizations giving medical service in the county

Dr Farmer, Chairman of the State Committee on Public Health and Medical Education, said that his committee had emphasized the graduate education phase of its work, but that many counties already had Public Health Committees which were doing excellent work. It was decided that if a county had an active Public Health Committee it should be considered to be the Public Relations Committee, also Dr Farmer said that he fully approved this plan

The committee next discussed methods of informing the officers of the County Societies and the members of the Public Relations Committees of the objects and plans of the State Committee on Public Relations The decision of the committee was that the best statements of the objects of the Committee on Public Relations were those contained in the eight principles adopted by the House of Delegates on May 21, 1928, and printed on page 803 of the July first issue of this Journal, and in the five principles contained in the 1927 report of the Committee on Public Relations, printed on page 797 of the July 15, 1927, issue of this Journal. It was voted to publish these two sets of principles in (These principles are reprinted the Journal on page 1433 of this Journal)

The Committee also authorized the preparation of reprints to contain the plan of Dr Ross, the two sets of principles, and extracts from the minutes setting forth the plans of the committee. It was voted to order 1,000 reprints for the use of the members of the committee in their Districts

There was considerable discussion regarding the activities of a county committee after it had made a survey. It was understood that the very fact of making the survey would involve a compliance with four of the five points outlined by the State Committee on Public Relations, and that, when a survey was completed, the county would have made an excellent start toward assuming the leadership that was assigned as the fifth duty of the county committee

W H Ross, Secretary.

CONFERENCE OF STATE SECRETARIES AND EDITORS

The American Medical Association held its annual conference of State secretaries and editors on November 17 and 18 in the headquarters of the Association, 535 North Dearborn Street, Chicago, Ill Those who attended it from New York were Dr D S Dougherty, Secretary of the Medical Society of the State of New York, Dr Orrin Sage Wightman, Editor-in-Chief, and Dr Frank Overton, Executive Editor

The Conference elected Dr T B Throckmorton of Iowa, Chairman The program which had been prepared by Dr Olin West, Secretary of the American Medical Association, was as follows

"Friday, November 16—10 00 A M

"Address, Edward B Heckel, Chairman, Board of Trustees of the American Medical

Association, Pittsburgh

"The Work of the Council on Medical Education and Hospitals with Hospitals and Laboratories N P Colwell, Secretary, Council on Medical Education and Hospitals, American Medical Association, Chicago

"Organizing for Efficiency H H Shoulders, Secretary, Tennessee State Medical As-

sociation, Nashville

"2 00 P M

"Address M L Harris, President-Elect, American Medical Association, Chicago

"A Number of Things Mr J G Crownhart, Secretary, State Medical Society of Wisconsin, Madison.

"More About the Educational Work of the Illinois State Medical Society Harold M Camp, Secretary, Illinois State Medical Society, Monmouth.

"Showing of the Harvey Film

"Saturday, November 17—9 00 A M

"The Objects of a State Meeting W G Ricker, Secretary, Vermont State Medical Society, St Johnsbury

"The State Medical Journal—Its Peculiar Field. Frank Overton, Executive Editor, New York State of Stat

YORK STATE JOURNAL OF MEDICINE, New York"
Since the number of topics was small, abundant time was given for discussion Nearly all the papers and discussions set forth the details of the experiences of secretaries and editors in inspiring the members of county societies to activity and making the annual meeting of the State society of practical value

Doctor Heckel extended the greetings of the Trustees of the American Medical Association Dr N P Colwell distributed reprints of the surveys contained in the Hospital number of the Journal of the American Medical Association of March 24, 1928, and explained the

means and methods of the investigation of the committee with special reference to those hospitals which could qualify for the training of internes in order to meet the laws of those states which require a year of hospital interneship before they can take the state licensure examinations

The paper of Doctor Shoulders dealt principally with methods used for arousing the interest of the small medical societies of Tennessee Three methods were especially described

(a) Combining several small societies into one major one

(b) Assisting the State Department of Health to arouse societies to take part in public health problems, especially those of an

emergency nature

(c) Putting on good programs for the District Branch meetings. In some instances this has resulted in the societies combining several for scientific meetings, but retaining their autonomy for demonstration purposes.

This paper was discussed by thirteen speakers, some of whom had used the methods of Doctor Shoulders with success, and others gave accounts of additional methods which

they had tried

Doctor Watkins, of Arizona, described a society of twelve members meeting every two weeks without a program, but instead, of a set program the members discuss the cases which they were treating in their private practice.

Dr R. B Adams, of Nebraska, described two devices used by the Nebraska State Medical Society

(a) Giving instructions to the students in the State Normal schools so that they would be able to carry messages of confidence in the physicians to the scholars in district schools

(b) An extensive exhibit at the State Fair with demonstrations and health examinations

Dr W G Ricker, Vermont, spoke of the Hospital Staff meetings as competitors of the county societies, and suggested a merger of the two Other speakers said that the remedy lay in one or two directions,—either confining staff discussions to strictly hospital topics such as the causes of deaths of hospital patients, or having the county society meet in the hospital with the staff providing a clinical program

Dr Wheaton, of Montana, suggested the use of the State Journal to carry instruction and inspiration to the rural members. This would require the writing of the reports of interesting meetings in an attractive manner.

Dr H O Reik, of New Jersey, spoke of the effect of the visits of state officers to the county societies, and said that the officers of the New Jersey Medical Society had visited

PUBLIC RELATIONS COUNTY SURVEY, No 1,-Suffolk

Suffolk was one of the counties surveyed in 1925, and its record is contained in the New York State Journal of Medicine of April 24, 1925, page 702 The record holds good for November, 1928, except that the population and the number of doctors are both increasing

The County Medical Society continues its leadership in all lines of medical endeavor and service which was begun in 1912 with a two-year campaign which resulted in the establishment of a County Tuberculosis Sanatorium and a highly successful system of field service for the discovery and treatment of tuberculosis patients. All the anti-tuberculosis service centers in Dr. E. P. Kolb, the Superintendent of the Sanatorium, who is also Secretary of the Suffolk County Medical Society, and one of the Executive Committee of the County Tuberculosis and Public Health Association

The County Medical Society continues to publish a monthly eight-page News Letter, and has expanded its scope to include the Dental and Veterinary societies, the County Tuberculosis and Public Health Association, the Board of Child Welfare, and all other organizations having to do with public health. The Tuberculosis Association sends about a thousand copies to persons outside of the professional ranks

The County Medical Society has continued some of the clinics which were described in the former survey, but group meetings, centering around the hospitals, have largely taken the place of the clinics. The largest and most successful group is that centering in the Southside Hospital at Bay Shore. This group contains about 40 doctors, and meets twice monthly—once as the Staff of the Hospital, and again at an evening supper followed by an educational lecture. The groups are practically district branches of the County Medical Society, and are considered to be such by the members.

With the groups meeting regularly and often, and the News Letter going to the members every month, the County Society finds two meetings annually to be sufficient. However, those meetings are highly interesting and successful. Each meeting combines three features.

- 1 A social noon-day lunch
- 2 A record and report of the public health and civic projects of the Society
 - 3 A scientific lecture

The last meeting—an average one—was attended by 35 members, seven public health nurses, and ten wives of the members. The nurses and the wives of the members are always invited.

The outstanding accomplishment of the Suf-

folk County Medical Society during the past two years has been the securing of a County Health Department after a two-year campaign whose progress has been described in the News Letters of the past two years

The Society has a Committee on Cancer, whose objects is to provide lectures on the disease before civic clubs. The last meeting of the Society appointed twenty-three physicians, each of whom should represent the Committee in his village, and should arrange for cancer lectures before its civic clubs.

Anti-diphtheria work has been sponsored by the County Medical Society, although its execution has been left to the individual doctors and health officers. The number of immunizations given have compared favorably with that of other counties.

The principal lay health organization in the County is the County Tuberculosis and Public Health Association, a branch of the State Charities Aid Association The leadership of the medical profession in the Association, and the independence of the Association from outside dominance, was settled about seven years ago after a vigorous controversy in which the physicians won every point Physicians constitute half of the Board of Directors, and occupy the offices of president and secretary, two of their number form the Executive Committee of the Association—all with the unanimous consent and approbation of the lay directors

The principal work of the Association is to provide two field nurses for visiting tuberculosis cases. An executive secretary runs a central office, and does much clerical work and correspondence regarding the News Letter and other public health work of the County Medical Society.

About 25 public health nurses are employed in the County Some are school nurses, and some work under the Red Cross, or the Metropolitan Life Insurance Company, but all are loyal to the medical profession. On the other hand, the physicians are loyal to the nurses, and invite them to their county society meetings. The nurses and social workers have an association which meets monthly, and usually has a physician on its program.

Parent-Teachers associations exist in most of the larger villages, and are on friendly relations with the doctors

The medical profession has the support of boards of trade, dinner clubs, social organizations, and the people generally. Its County Medical Society knows the various communities, and adapts its program of activities to their needs

W H Ross

cellent account of the work of the National Committee on the Cost of Medical Care

Journal, Sept 1, page 1056)

Dr Frank Overton, Executive Editor of the New York State Journal of Medicine, was the last speaker on the program of the conference, and had only a limited time in which to present the subject "The Peculiar Field of the State Journals of Medicine" He distributed mimeographed copies of an outline of the talk which he had expected to give and he also distributed reprints of an article which appeared in the New YORK STATE JOURNAL OF MEDICINE OF October 1, on the subject of indexing and abstracting news items regarding the practice of medicine by medical societies He then gave a brief talk showing that the peculiar field of the State Journals of Medicine was to record those activities which belong to the medical profession, or physicians as a group, in distinction from the individual Such records included the promotion of anti-diphtheria campaigns, popular medical lectures, the promotion of county health departments, and the relation of physicians to public health nurses He closed with a brief discussion of improving the State Journals along five lines relating to news items

1 More items

2 More complete explanations of each activity

3 More emphatic forms of printing

4 Indexing the items

5 Abstracting similar items from other jour-

Doctor Wightman, Editor-in-Chief of the New YORK STATE JOURNAL OF MEDICINE, discussed its departments and showed how they met the need of the Society He said that the news department was intended to cover those fields which would have a permanent value in future years as showing the development and evolution of the practice of medicine by the medical societies

Doctor Dempster described the action of the Wayne County Medical Society of Detroit, in raising its dues in order to employ a full time secretary who should devote himself principally to the discharge of the civic activities of the members of the society He said that the growth of the civic consciousness was especially marked among physicians, and that the record of the activities of the medical society, as distinguished from the individual doctor, was contained almost exclusively in the State Journals of Medicine

Dr Olin West spoke at some length on the necessity that the State Journals should record the activities of the societies of the counties and states, for the record constitutes history in the making He said that it was not to the credit of the American Medical men that the story of the activity of a society was not recorded as it developed from day to day He was especially anxious to see a more extensive record of these activities made in the State Tournals, and that it be indexed in order to be readily available

The Harvey film, which was shown on the afternoon of November 16, consisted of motion picture demonstrations of the experiments by which Harvey demonstrated the circulation of the Each experiment was introduced with a description of the demonstration in Harvey's own The film requires nearly half an hour to show, but it has a vivid action which will hold

the attention of a thoughtful audience

TRI-STATE CONFERENCE

The tenth Tri-State Conference of the officers of the Medical Societies of New York, New Jersey and Pennsylvania, was held on November 10, 1928, in the Hotel Chelsea, Atlantic City present from New York were Dr. Harry R. Trick, President of the Medical Society of the State of New York, Dr. James N. Vander Veer, President President Dr. James N. Vander Veer, President President Dr. James N. Vander Veer, President Dr. James N. Vander Veer, President Dr. James Dr. James N. Vander Veer, President Dr. James dent-elect, Dr James T Sadher, Past President and Chairman of the Committee on Public Relations, Dr J S Lawrence, Executive Officer, and Dr Frank Overton, Executive Editor

The principal topic for discussion was "The opportunities of a County Medical Society" Dr Lawrence discussed the opportunities under four headings

Scientific

(a) Clinics on scientific programs of county medical societies, with the cooperation of medical schools if available

(b) Research For example, a county society studying maternal mortality for a year, with every doctor reporting his cases in detail after the manner of a hospital staff meeting Other subjects suggested were the common cold and heart disease.

(c) Reports of studies by hospital staffs

(d) Surgical topics of interest to the general

practitioner

Social advantages, the county society overcoming individualism in the practice of medicine

Public Relations

- (a) Acquire an intimate knowledge of all organizations engaged in health work in the county Dignified silence on public health problems by physicians results in the medical profession being ignored by the people. The people expect physicians to advise the public in all health matters. such as water supplies
 - (b) Cooperation with departments of health
- Internal Relations
 - (a) The "One-Man" society(b) The "Two-meetings" society

(c) Distraction of hospital staff meetings

every county medical society in the state dur-

ing the last year

Dr D S Dougherty, of New York, spoke of the value of the liaison officer for doing field work among county medical societies

Doctor Myerding, of Minnesota, spoke of the value of the woman's auxiliary in stimulating

interest in the county societies

Doctor Long, of Nebraska, said that some societies started the year by appointing a separate program committee for each meeting that was to be held during the year

Mr J G Crownhart, the Secretary of the State Medical Society of Wisconsin, spoke on a number of things, including the following

(a) A description of the meeting of the State Secretaries in the American Medical Association building on November 15

(b) Mimeographed bulletin sent to county

societies monthly

Assisting county medical societies to arrange clinical programs

(d) Transacting business at the end rather

than at the beginning of the meeting

Consolidating smaller societies into units as a last resort and not as a first aid

Dr F C Warnshuis, of Michigan, said that the State Society had arranged a program for smaller societies on the basis of mortality The subject that was chosen for a particular society was the diseases which produce an abnormally high death rate in that county

Dr H M Camp, Secretary of the Illinois State Medical Society, described the educational work of that society One-fifth of the income of the State Society was spent on this work under the direction of a central commit-Two thirds of the money was spent on the graduate education of the doctors, and one third on the education of the public in medical matters

The service of the committee to the doctors consisted in help in society programs, sending out lecturers on scientific subjects, turning over to the county society the management of the State's program of clinics for crippled children, and other activities which were to be of assistance to the doctors in their practice of medicine

The popular education of the public consisted in

Conducting a speakers' bureau for the purpose of giving medical talks to groups of people, such as clubs, factory workers, and high-school students

Radio talks on Tuesday noons

Press news items and health columns (c) Doctor Dempster said that the State of Michigan had a similar committee, but it was under the joint management of a number of the health organizations, including the State Medical Society, the dental society, medical

schools, departments of health, and lay organ-The Committee supplies lecturers, prepares press notes, gives radio talks, and composes outlines with local speakers in popular talks on such subjects as the heart

Dr F B Stephenson of Colorado described the activities of the State Society in public health dur-

ing the State Health Week

Dr Bulson of Indiana, said that Indiana maintains a speakers' bureau in order to supply popular lectures on medical subjects It also sends out a weekly letter on health to the newspapers

Dr J B Morrison, of New Jersey, described the system of popular health instructions in New Jersey, emphasizing principally the work of a full time woman lecturer and the radio talks which are broadcasted weekly

Dr W G Ricker gave a paper on the objects of the state meeting, emphasizing the difference between adhesion and cohesion. He said that his object was to produce a cohesion of the medical profession by means of the friendship and enthusiasm of the societies. He discussed especially three points

(a) The need of giving information of new developments in medical matters or a summary

of the year's progress

(b) Promoting the contact of the medical leaders with the members of the County Societies

(c) The minor position which should be accorded to accessories on the program such as dinners, ladies' entertainments, and exhibits

Doctor Morrison of New Jersey spoke of the excellent results of symposiums in the annual New Jersey also requires papers to be submitted to the scientific committee before they are read

Doctor McBrayer, of North Carolina, said that one-third of the state's membership of 2,200 attends the state meeting. The program committee consists of the eight chairmen of sections, eight counsellors, and about eight other officers, all of whom meet in a joint session and arrange the program a long while before the meeting one-third of those invited to take part in the program are chosen from outside the state

Doctor Adams of Nebraska objected to placing organized sport on the program for it distracts the attention of the members from the scientific program

Doctor Olin West, Secretary of the American Medical Association made a plea for more serious scientific work on the part of the State Medical Society, and said that an extra day of a program meant one more day of golf Doctor West advocated clinics on the programs so as to give the doctors something which they can use when they In his opinion the promotion of the practice of medicine was the principal object of a state society meeting Correlated topics, such as economics and the cost of medical care were secondary However, Doctor West gave an exVeer referred to the unwillingness and possible incapacity of 'the average doctor to take notes and report the proceedings of societies, and therefore a stenographer at every society meeting might be desirable.

Dr Donaldson spoke on the system of having a reporter for every county society as in Pennsylvania and New Jersey, but the difficulty was to find the doctor who liked to do the work. They all dislike to write compositions now just as they did in School

Dr Sadlier said that the realization of the need of reporting the activities of societies was of slow growth in the mind of the officers of state societies. He said that he had made notes on every society meeting that he had attended, but that if they were published, they would require editing in order to avoid giving offense.

Dr Reik said that in the past year every one of the twenty-one counties of New Jersey had been represented by reports in the State Journal

Dr Morrison suggested the great value of a full index and the desirability that it be printed

quarterly

The third topic to be discussed was that of Malpractice Insurance Dr Morrison spoke regarding the danger of doing business with an insurance company which cannot legally operate in the state, and said that Massachusetts and New York were in agreement with New Jersey in this matter (This subject was discussed in the Legal Department of this Journal of August 15, 1928, page 1005, by Mr Striker, Counsel for the State Society, and again on pages 1295 of the October 15 Journal in the report of the special committee on malpractice insurance)

FRANKLIN COUNTY

The regular annual meeting of the Medical Society of the County of Franklin, was held at the Hotel Flanagan, Malone, N Y, on October 24, 1928 Dinner was served at 1 P M, and a business session opened at 2 P M Members present Dr Percival F Dolphin, vice-president, in the chair Dr George F Zimmerman, secretary-treasurer, Drs Hayes, Brumfiel, Stamatiades, White, Blackett, Kingston, Sprague, Thurber, Rust, de Grandpre, Wilding, Finney, Tobin, Perkins, McCarthy Visitor Dr Stanley W Sayer of Gouverneur

Two applications for membership were presented and approved Dr Daniel M Brumfiel, Saranac Lake, and Dr Alfred H Duerschner, Ray Brook.

It was suggested by Dr Blackett that the delegate to the State Society meeting bring before that body the proposition that doctors as well as undertakers be made preferred creditors in the settlement of estates

Moved by Dr Finney, and seconded by Dr McCarthy, that the State delegate bring the matter up before the State Legislative Com-

mittee at the next meeting of the State Society Carried

Moved by Dr Hayes, and duly seconded, that an annual report be asked of the American Association of Medical Milk Commissions of their activities in Franklin County Carried

The following officers were elected for the ensuing year President, Dr Percival F Dolphin Malone, vice-president, Dr Edward S Welles, Saranac Lake, secretary-treasurer, Dr George F Zimmerman, Malone, censor for three years, Dr Raymond G Perkins, Malone, delegate to State Society, Dr Charles C Trembley, Saranac Lake

At the scientific session the following papers

were read and discussed

1 "A Case of Hodgkins' Disease," Dr John M Hayes, Saranac Lake

2 "Pneumonia," Dr F W McCarthy,

North Bangor

3 "Toxemia of Pregnancy," Dr G C de-Grandpre, Tupper Lake

Each of the above papers elicited considerable discussion of practical value

G F ZIMMERMAN, Secretary

(d) Choosing the President and the Secretary The subject was discussed at length by nearly everyone present

Dr James N Vander Veer developed the fol-

lowing topics

- (a) The graduate education work of the New York State Society in overcoming individualism in the practice of medicine
- (b) The plan that the State Society should draw up a uniform program for the meetings of each society

(c) Survey of the hospitals by a county society

(d) The University of Vermont's plan to send each senior medical student out to practice medicine with a doctor in private practice.

(e) Value of visitations of officers of the State

Society to the county societies

(f) Relation to the hospital staff meeting

Dr I G Simonton, President of the Medical Society of the State of Pennsylvania discussed the two topics

(a) The importance of the choice of a meeting

place

(b) Program hogs

Dr James E Sadlier, Chairman of the Committee on Public Relations of the New York State Society discussed the following topics

(a) Contrasts of two pairs of societies, a small with a large one, and one with no leader with one

well led for years

(b) Importance of frequent contacts of the State Officers with the County societies, and the deplorable results of failure of the State Society to advise a county society in solving a problem too big for it

(c) A hospital staff meeting to be considered a district branch of the county medical society

Dr E C Morgan, Past-President of the Pennsylvania State Society, spoke of the plans which were not entirely satisfactory on account of medical politics

(a) Evening meetings beginning with a supper

(b) Meeting in the hospitals in rotation Dr Harry R Trick, President of the New York State Society, spoke on the following topics

(a) Lectures to the senior class of the University of Buffalo on the County Society, its service to physicians, and the reasons why the young graduates should join it, for it will be his medical school, and his fraternity throughout his life

(b) County Societies to be organized for discharging the civic problems of the medical pro-

fession

Dr W T Sharpless, a Trustee of the Pennsylvania State Society, defended the hospital staff meeting and said that where there was a good hospital, the county society also does good work An interesting speaker plus a good dinner gets the crowd

Dr W F Donaldson, Secretary of the Pennsylvania State Society, spoke of the value of sociability among the members in promoting interest in the County Society A member comes in order to meet men of his own set or clique

Dr J B Morrison, Secretary of the Medical Society of New Jersey, described the excellent results following the visits of the State officers to the county societies in New Jersey

Dr H O Reik, spoke of the value of the Women's Auxiliary in promoting attendance at

the State meeting

The second topic for discussion was "The peculiar field of the State Journals of Medicine" Dr Frank Overton, Executive Editor of the New YORK STATE JOURNAL OF MEDICINE, opened the subject by distributing reprints of an article entitled, "Indexing and abstracting news items of Medical Societies," which had appeared in the New York State Journal of Medicine on October first This article showed that news of the activities of the medical societies of the counties and states was found only in the State If anybody wished to find a record of the practice of medicine by a medical society, such as an anti-diphtheria campaign, he would have to look in a State Journal The deep interest that has recently developed in the practice of public health by state and county medical societies makes a full record of that Since the State Journals practice desirable are the organs of the medical societies, they are the natural repositories of news of the activities of the societies along all lines There is therefore a great need that the State Journals should carry full accounts of the activities of the societies

Dr Overton spoke of two phases of the prob-

lem of publishing the account

1 Securing the reports The officers of the societies must realize the value of the records to others who are ambitious to undertake similar work

2 The editors of the Journals must index the items in order that they may be made available in

future months and years

Dr Overton called attention to the department "Our Neighbors" in the New York State Jour-NAL OF MEDICINE, which contains abstracts from other State Journals describing activities which may be of interest to physicians in New York State. He also showed a special index of the Journal for twenty months showing the activities of county and state societies that had been re-This index was by topics and referred to reports of presidents and secretaries and chairmen of committees, as well as separate news topics. The surprising thing about the index was If a similar index were made of the news topics in the New Jersey and Pennsylvania Journals, the list would be far longer than would be supposed by one who had not taken special interest in the items

Dr Lawrence spoke of the desirability of giving a humanitarian touch to the Journal in order to balance the scientific department Dr Vander

1

THE DAILY PRESS

MEN AND MACHINES

The daily papers have been filled lately with news of the investigations into the cause of the sinking of the steamship *Vestrus* with the loss of one hundred lives The *New York Herald Tribune* of November 23 ascribes the loss of life to a mental rather than physical failure, and says

"The fact seems mescapable that unless the master of the Vestris had failed in judgment—through what mental stroke no one is ever likely to know—and the officers beneath him had failed in seamanship, no lives need have been lost Granted able seamanship and neither skimping on repairs nor faulty inspection would have cost a life.

"The question plainly lies deeper in the whole conduct of the merchant marine since steam and the great liners transformed the character of seafaring Joseph Conrad wrote feelingly of the change. The master has declined in prestige and power. The vast scale of the business and its machinelike precision have tended to reduce the respect paid to the human factor. Courage did not fail on the Vestris. To the credit of officers, crew and passengers, it can be said that no petty motives prevailed. The main failure that appeared was a failure of training, of command

"No one will wish to speak harshly of fellow-beings who, confronted by a grave test for which they were ill-prepared, failed to rise to the occasion. The occasion calls not for hasty condemnation, but for sober study and reflection. This country is returning to the sea after several generations of absence. The chief lesson of the Vestris, so far as the record thus far discloses, is the supreme importance not of machines, but of men. For its navy as for its merchant manne, America must develop seamen who are fit descendants of its old and high traditions. We

hope that no demand for laws or rules or retribution will blind eyes to this major lesson of the Vestris"

Physicians who practice on the south shore of Long Island can appreciate the editorial A generation ago vessels often ran aground on the bar Physicians were called to attend the injured seamen aboard them, and were rowed to the ships by the crews of the U S Coast Guard stations The crews at that time were composed of fishermen who had lived their lives on the beach and often could not read or write, and were almost afraid of strangers, but they were at home in the surf, for every day they rowed a dory alone through the breakers to tend their fish nets and It was a sight to inspire confidence to see one of these men standing erect like a king on the stern of a tossing life boat, and roaring out his commands to his six oarsmen, who on land were as unlearned and diffident as himself physician had no fear of sea and waves when such a crew of experienced surfmen rowed him to the wreck But today a doctor would hesitate a long while before he would trust himself to a lifeboat, for the crews of the coast guard are required to be educated men, and able to receive and send messages with signal flags, and just because they are educated in book learning, they have had no opportunities to learn to handle a boat in the surf, and so they are likely to be incompetent in a lifeboat

The officers of a sailing vessel fifty years ago were chosen because their ability to command had been tested and proved in a hundred storms and emergencies where machinery was useless, and trained experience, hard and long, was the only source of salvation for both the vessel and

the crew

SNUFF

Do you ever see anyone taking snuff? Somebody takes a lot of it, according to the following extract from an editorial in the New York Herald Tribune of November 11

Four years ago a Chicago antiquary wrote that while 'it has often been stated that snuff taking is practically extinct,' London jewelers report 'a ready sale for daintily jeweled snuffboves' And now our own United States Department of Agriculture comes out with the

startling pronouncement that this country, which a half century ago produced only 2,000 tons of snuff a year, now makes more than 20,000 tons, and that little of it is exported!

"Twenty thousand tons is a lot of snuff Who uses it? The department says that its use is particularly common among workers in industries where smoking is prohibited and among immigrants from countries where snuff taking is still a national habit"

MEDICAL WARES

MEDICAL PUBLICATIONS

The essential of a successful medical book is its truthfulness. A doctor buying a new book on medicine or surgery expects to find in it the latest scientific information on the subject of which it treats. Publishers emphasize their conformity to the latest advance in medical writing and often encourage buyers to place newness and novelty above other qualifications, but a good medical book does not lose its usefulness in a few years, for it still contains as many fundamental facts in science as it ever did. Dr. Abraham Jacobi once said that if a doctor knew medicine as it was set forth in the literature of five years ago, he would not need to study any more

Medical publications may be divided into two great classes (1) periodicals, (2) books Each has its peculiar field and a physician can-

not afford to neglect either one

The peculiar field of the medical journal is that of a journal or diary kept by a doctor, while the medical book is a summary of the doctor's experience and judgment in a particular line over a considerable period of time. When medical literature has accumulated in the medical journals for a year or two, someone with a genius for investigation will collect and classify the records and add those from his own experience and will produce a book which sets forth the state of the science in that particular subject at the time in which it was written

An article or a book represents much more than the opinion and experience of the author Most articles in a journal have been presented before a medical society, and have been subjected to the criticism of the author's colleagues. The fact that they have received the approval of a group of his fellow workers is what makes an author's article valuable to the reader.

When an article is offered to a medical journal, the editor at once looks for the name of the Society before which it was read, and if it has not been given before a Society, the editor will consider the standing and reputation of the author. If the writer is unknown the editor will probably correspond with the County Medical Society to find his standing among his fellow doctors. Only in this way can an editor be reasonably sure that the observations contained in the article are worthy of distribution through the profession.

A medical journal is the crucible in which crude ideas are mingled with those already tested and their dross separated from their

golden nuggets of truth

The medical society initiates the assimilation and purification process, while the Journal preserves the worthy material and sends it forth to be further tested by unknown and even hostile observers. If it survives this second test, it is considered worthy of being added to the great reservoir of accepted medical science which is contained in books.

The medical book embodies the results of analyses and summaries of articles which have appeared in medical journals. A typical medical book will give the source of information on which the opinions are founded—and in nearly every instance they are references to articles in medical journals. Many of the records in the journals to which reference was made will have been generally accepted while others will still be unsettled. The first-class medical book will distinguish between fact and judgment and yet it will give a true picture of the state of knowledge of the subject at the time the book was written, even though some of that knowledge is as yet uncertain

When the nature of diabetes was unknown, the art of medical practice required the elimination of sugar from the diet, but when insulin was discovered the whole science and art of treating diabetes was changed and what was before only a surmise became a certainty. The older books on diabetes were not wrong, they simply lacked the facts of modern scientific knowledge, but it is very seldom that a newly discovered fact or principle will upset the practice of medicine as quickly as insulin has done in regard to diabetes

The value of a medical book will depend on the publishing house as well as the author. The imprint of a first-class house is a guarantee of the value of the book. Few physicians realize the pains and expense which a reputable publisher will take to be sure that a book is true as to its facts. Then, too, there will arise the question of the probable sale of a book. Commercialism is worthily involved in the preparation of a medical book. If the work is needed, it will be bought, while if there is no call for the book, it would be a kindness to tell the author that his time spent on its preparation should be more usefully employed.

Ŷ

BOOKS RECEIVED

Acknowledgment of all books received will be made in this column and this will be deemed by us a full equivalent to those sending them. A selection from this column will be made for review as dictated by their merits or in the interests of our readers.

- DISEASES OF THE EAR, NOSE AND THROAT Medical and Surgical By WENDELL CHRISTOPHER PHILLIPS, M D Seventh revised Edition. Octavo of 922 pages, illustrated Philadelphia, F A. Davis Company 1928 Cloth, \$900
- Surgical Diagnosis in Tabular Outline for Students AND Physicians. By Dr. A. J. Cemach. Authorized translation by Edward L. Bortz, M.D. Large octavo of 109 tabular forms and 129 plates. Philadelphia, F. A. Davis Company, 1928. Cloth, \$12.00
- PREVENTIVE MEDICINE. By Mark F Boyd, M D Third Edition. Octavo of 475 pages, illustrated Philadelphia and London, W B Saunders Company, 1928 Cloth, \$4.50
- AN INTRODUCTION TO EXPERIMENTAL PHARMACOLOGY By Torald Sollmann, M. D., and Paul J. Hanzlik, W.D. Octavo of 321 pages. Philadelphia and London, W. B. Saunders Company, 1928. Cloth, \$4.25.
- Surgical Clinics of North America Vol 8, No 4 August, 1928 (Philadelphia Number) Published every other month by the W B Saunders Company, Philadelphia and London Per Clinic Year (6 issues) Cloth, \$1600 net, paper, \$1200 net
- Hughes' Practice of Medicine. Including a Section on Mental Diseases and One on Diseases of the Skin By R. J. E. Scott, M.A., B.C.L., M.D. Fourteenth Edition. 12mo of 839 pages, with 63 illustrations Philadelphia P. Blakiston's Son and Company, 1928 Flexible leather, \$400
- THE DETERMINATION OF HYDROGEN IONS AN Elementary Treatise on Electrode, Indicator and Supplementary Methods with an Indexed Bibliography on Applications By W Mansfield Clark, MA., Ph D Third Edition Octavo of 717 pages Baltimore, The Williams & Wilkins Company, 1928 Cloth, \$650
- BRONCHIAL ASTHMA Its Diagnosis and Treatment. BY HARRY L. ALEXANDER, A. B., M. D. 12mo of 171 pages illustrated. Philadelphia, Lea and Febiger, 1928 Cloth, \$2.25
- THE TREATMENT OF DIABETES MELLITUS By ELLIOTT P JOSLIN, M D Fourth Edition. Octavo of 998 pages, illustrated. Philadelphia, Lea and Febiger, 1928 Cloth, \$900
- DISEASES OF THE GALL BLADDER AND BILE DUCTS A
 Book for Practitioners and Students By EVARTS AMBROSE GRAHAM, AB, MD., and others Octavo of
 477 pages, illustrated Philadelphia Lea and Febiger,
 1928 Cloth \$8.00
- A TEXT-BOOK OF FRACTURES AND DISLOCATIONS COVERING Their Pathology, Diagnosis and Treatment By Let loog Speed S B M D Second Edition Octavo of 952 pages, illustrated Philadelphia, Lea and Febrger, 1928 Cloth, \$1100
- Modern Medicine. Its Theory and Practice in Original Contributions by American and Foreign Authors Edited by Sir William Osler, Bart, M.D. Third Edition thoroughly revised Re-edited by Thomas McCrae M.D. Assisted by Elmer H. Funk M.D. Volume 6. Diseases of the Nervous System—Dis-

- eases and Abnormalities of the Mind Octavo of 964 pages, illustrated Philadelphia, Lea and Febiger, 1928 Cloth, \$900
- CONSTITUTIONAL IN ADEQUACIES AN Introduction to the Study of Abnormal Constitutions By NICOLA PENDE, M D Translated by SANTE NACCARATI, M D Octavo of 270 pages Philadelphia, Lea and Febiger, 1928 Cloth, \$3.50
- Health and Pleasure Resorts of Central Europe.
 Describing the Natural Mineral Water Sources and
 Their Therapeutical Indications By Morris Schott,
 M D 12mo of 172 pages New York, The Author,
 1928
- Answers to Questions Prescribed by Nurses' State Board By Robert B Ludy, M.D. Edited by Edgar S Everhart M.D., and J. Clarence Fune, M.A., Sc.D. Octavo of 498 pages Philadelphia, David McKav Company, 1928 Cloth \$3.00
- ESSENTIALS OF PRESCRIPTION WRITING By CARY EGGLESTON, M D Fourth Edition 16mo of 153 pages Philadelphia and London, W B Saunders Company, 1928 Cloth, \$1.50
- A TEAT-BOOK OF SURGERY FOR STUDENTS AND PHYSICIANS By W WAYNE BARCOCK, A.M., M.D. Octavo of 1367 pages, with 1041 illustrations Philadelphia and London, W B Saunders Company, 1928 Cloth, \$1000
- RECENT ADVANCES IN PHYSIOLOGY By C. LOVATT EVANS, D.Sc., M.R.C.S. Third Edition 12mo of 403 pages, with 86 illustrations Philadelphia, P. Blakiston's Son & Company, 1928 Cloth, \$3.50
- Medical Clinics of North America Vol 12, No 2 September, 1928. (Nebraska University Number) Published every other month by the W B Saunders Company, Philadelphia and London Per Clinic Year (6 issues) Cloth, \$1600 net, paper, \$1200 net.
- Syphilis Acquired and Heredosyphilis By Charles C. Dennie, BSMD 12mo of 304 pages, illustrated New York and London, Harper & Brothers, 1928 Cloth, \$250 (Harper's Medical Monographs)
- A SHORT HISTORY OF MEDICINE. Introducing Medical Principles to Students and Non-Medical Readers. By Charles Singer, M.A., M.D. Octavo of 368 pages illustrated. New York, Oxford University Press, 1928 Cloth, \$300
- DISEASES OF INFANTS AND CHILDREN BY HENRY DWIGHT CHAPIN A W, MD, and LAWRENCE THOMAS ROYSTER, MD Sixth rev Edition Octavo of 675 pages, illustrated New York, William Wood & Company, 1928 Cloth \$750
- THE PROBLEM CHILD AT HOME A Study in Parent-Child Relationships By MARY BUELL SAYLES Octavo of 342 pages New York, The Commonwealth Fund, 1928 Cloth, \$150
- LABORATORY MANUAL OF THE MASSACHUSETTS GENERAL HOSPITAL. BY ROY R. WHEELER, M.D., and F. T. HUNTER, M.D. Second Edition. 12mo of 101 pages Philadelphia, Lea and Tebiger, 1928. Flexible leather, \$1.75

BASIS OF SUCCESS

All doctors frequently discuss the causes of the success or failure of their professional colleagues, and a few have dared to write books on how to succeed in a medical career, but the subject is elusive, and advice on how to succeed is as ineffectual as that on how to play a piano Edward Hope discusses this problem of business success in general in the New York Herald Tribune of November 23, in the daily column called "The Lantern," using as his text the announcement that the professors of economics of Harvard University are investigating the subject Hope says

"The investigators have sent questionnaires to 15,000 men who are heads or high officers of successful businesses. They are asking each man to tell them the social, educational and financial backing with which he entered business, they are asking him to trace the course of his movements in business, so that they may find the factors common to most business successes, and reason therefrom. When all the answers are in and have been classified and added up and divided and cross-multiplied, they may find themselves in possession of priceless information.

"Or they may not

"The questionnaire fillers-in may admit family superiority, but we doubt that any of them will go further than the statement that they were kind of educated and had a little money, just a few dollars. This, too, may cast doubt on the accuracy of the final analysis of returns."

After commenting on the probable reactions of the business men to the insidious flattery implied in the questionnaire, Mr Hope discusses a practical, as contrasted with a cultural education, and says

"The institutions of learning are bending their energies more and more toward Practical Training, toward teaching what their students can Use in After Life And that means use to make money

"If Harvard manages to discover the conjuring formula to commercial success, it is safe to assume that the information will be passed along to the students. It would be sinful to keep the secret

"Business, however, is generally conceded to have money-making as its end, only the most poisonous hypocrites deny it. And money, at the last analysis, buys only one really valuable commodity leisure. What we are always wondering is what pleasure a man can derive from protracted leisure if his education has given him nothing but business technique"

Mr Hope concludes by directing the attention of the Harvard men to a source of information

that they probably overlooked

"The economics professors are going to trouble and expense to find out something they could learn from the advertising pages of a few magazines

"Readers of periodicals know the elements of success in business and social life. They are

"A pleasing breath "Good English "Normal nose pores

"Ability to quote the classics in an emergency

"Garters

"Conversational French

"Thick hair

"A working knowledge of etiquette

"Modish clothing
"Controlled perspiration
"Mastery of elocution

"Teeth (and gums to go with them)

"Rubber heels
"A youthful figure

"Cigarettes (to prevent coughing, fatness,

embarrassment, and so on)

"With due respect, we submit this list to the gentlemen at Harvard If they wish to make a cash award for our services, we shall be glad to accept We have more plans for our future leisure than we shall ever have time to carry out."

SUICIDE AMONG PHYSICIANS

The New York Sun of November 8 contains an editorial from which these extracts are taken

"Are suicides more frequent among physicians than among men of other professions? The question is brought up again by statements made recently before the Royal Institute of Public Health in London by a Member of Parliament Dr E Graham Little, who asserted that 'the doctor's consulting room, far from being a gold mine, is often the shortest route to the cemetery'

"The figures given for 1921 by American

Medicine were Physicians, 86, lawyers, 57, clergymen, 21, bankers, 37. But that was in an exceptional period of stress and strain due to after-war conditions. Moreover, the returns must be scrutinized with great care and comparisons must be made with full knowledge of the number of persons in each calling if deductions are to be even interesting, not to say valuable. Perhaps the strain on practicing physicians is greater than the strain on followers of other professions, but this is yet to be established."

what cannot? It would be very hard to find any room for criticism of doctors, if the united forces of the various societies took it upon themselves to enforce the rules and regulations. It is a fact that is often observed in life, that the devils have the upper hand in so many places that idealism is often destroyed in its incipiency. The weakness of the profession is shown in its not enforcing the essentials of the code. But after all every man in the profession should be so middled that he needs no code of ethics by which to regulate his actions for he is an educated part of the body politic.

A little combativeness on the part of doctors, it seems to the reviewer, is needed today to destroy a type of propaganda that is issuing from many places, even from a medical school. The propaganda of the health pickling stations is everywhere, and it is mostly lies, and interferes in honest dealing with many patients.

The book is recommended because it will enlighten doctors of a stream of subtle propaganda, and because if they have any sense of irritation, they will be irritated before reading many pages

J A. BUCHANAN

MEDICAL CLINICS OF NORTH AMERICA. Vol 11, No 4, January, 1928 Vol. 11, No 5, March, 1928 Vol 11, No 6, May, 1928 Published every other month by the W B Saunders Company, Philadelphia and London. Per Clinic Year (6 issues) Cloth, \$1600 net, paper, \$12.00 net.

Vol II, No 4, January, 1928 (Brooklyn Number)

The January, 1928, number marks the advent of Brooklyn clinicians as contributors to The Medical Clinics of North America. Among the many excellent contributions one finds interesting discussions of ascites, polycythemia, intracranial hemorrhage of the newborn treatment of pneumonia, gastric symptoms in syphilis, Niemann-Pick type of lipoid cell splenohepatomegaly, syphilis, tachycardias, bronchoscopy, closure of the abdominal aorta, carcinoma of the esophagus, toxic hepatitis and hepatolysis following the use of atophan, the eye in internal medicine, dystrophic infants, asthenia in endocrine disorders, cardiac failure and Brill's disease.

M A. RABINOWITZ

Vol 11, No 5, March, 1928. (Tulane University Number)

The March 1928, (Tulane University) number is specially noteworthy for its clinics on malarial hemoglobinura, internal mycoses, malarial treatment of syphilis, cisternal puncture in the treatment of meningrococcal meningities, echinococcus cyst of liver, and epidemic encephalitis

M A. RABINOWITZ

Vol. 11, No 6, May, 1928. (Mayo Clinic Number)

A splendid addition to clinical medicine is the Mayo number for May, 1928. A terse style, clearness of expression, and valuable information characterizes each contributor. It is possible for the reviewer to mention only a few of the subjects of these splendid discussions—hemochromatosis, jaundice, esophagus and cardia lesions, gastric ulcer, treatment of ascites, jaundice and peripheral neuritis familial tendencies, amoebic dysentery, precocious puberty, preeclamptic toxemia, unusual urologic cases, hypertension, cyanosis, polycythemia, thromboanguitis obliterans, migratory superficial philebits, syncope, pelvic bone lesions, gout, erysipelas, undulant fever, and abdominal migraine.

M. A. RABINOWITZ

SURGICAL CLINICS OF NORTH AMERICA. Vol 8, No 1, February, 1928 Vol 8, No 2, April, 1928. Published every other month by the W B Saunders

Company, Philadelphia and London Per Clinic Year (6 issues) Cloth, \$1600 net, paper, \$1200 net.

Vol 8, No 1, February, 1928 (Laher Clinic Number)

This number is of exceptional value. The Lahe, Clinic presents its vast stores of clinical material in concise form. The problem of gastro-jejunal ulcer is lucidly presented so is the value of jejunostomy in peritoritis. The salient points of operative technique in various operations (breast amputations, thyroidectomy, etc.) are discussed and very well illustrated. The articles are crowded with precise and valuable information.

Vol 8, No 2, April 1928 (New York Number)

In this New York number many acknowledged leaders in their respective fields have contributed their opinions. Erdman on the gallbladder, Lilienthal on surgery of apical tuberculosis. Moorhead on the arthrotomy of the kneejoint, Pugh on urmary obstruction, etc. Fifty pages are devoted to a detailed discussion of intracranial tumors. Most of the contributions are of great clinical value.

George Webb.

Pulmonary Tuberculosis Its Etiology and Treatment. A Record of Twenty-seven Years' Observation and Work in Open-Air Sanatoria By David C. Muthu, M.D. Second Edition, enlarged Octavo of 381 pages, illustrated New York, William Wood and Company, 1927 Cloth, \$5.00

In this work, the author, qualified by twenty-seven years' observation and work in open-air sanatoria, surveys the scientific the sanatorium and the social aspect of tuberculosis. From the scientific point, he deals mostly with the etiology of the disease laboring at great length to show the slight importance of the tubercle bacillus, that the disease is not due to infection by bacilli, that sputum of diseased ones needs little or no consideration as a factor in causation, but that the principal factors are poverty, malnutrition, poor hygienic environment and food deficient in quantity and in vitamins. These views are supported by innumerable quotations and by a close study of the social and economic conditions of England and India. "All diseases are the outcome of, or association in the first place with, deficiency of food or some food accessory factor"

In his preface, the author states that "the reader may not be able to follow us all the way"—and that is true also of the reviewer Some of us have not yet arrived at the place of accepting Abrams electronic theory which this author has been instigating since 1923 and with the uncanny diagnostic accuracy resulting therefrom with which he "has been struck." Not being sure that "the patient faces the West and is grounded" may explain the diagnostic lack of success of some readers

With the use of psycho-therapy in addition to other approved therapeutic measures, both reader and patient must give warm approval, but when the author states that "the fear of cancer can produce cancer," when referring to tuberculosis he quotes approvingly Le Bon that "Ideas, sentiments, emotions and beliefs, possess in crowds a contagious power as intense as that of microbes," when he states that he "has seen cases of cholera and bubonic plague occurring through sheer fright or nervous fear" and that "others (Nash) have noticed outbreaks of smallpox, measles, erysipelas, hydrophobia, etc., have been propagated from grave nervous apprehension," then in the words of Mr Artemus Ward "this is too much"

Even rather verbose, the book is written in pleasing polished diction, the publishers have creditably done their part, still the physician in this country at least will find little of value that is new

T A. McGoldrick.

BOOK REVIEWS

Percival's Medical Ethics Edited by Chauncey D Leake. 12mo of 291 pages, illustrated Baltimore, The Williams and Wilkins Company, 1927 Cloth, \$3 00

The author of this edition of Percival's Medical Ethics is not a doctor, nor is the subject matter written particularly for the medical profession. It is another one of those frequent occurrences in this present day,— an attempt to "enlighten the public." It is good for doctors to read these enlightenments of the public, because some of the enlightenments are not very desirable.

Mr Leake is a mouthpiece for much propaganda of the health pickling stations, the public spirited citizens,

and public health chatter

The Professor starts in by taking issue with the possibility that the doctor while making a living can sell what he has to sell to the public without trying to hood-wink the public at the same time. The reviewer wonders if knowledge about pharmacology can be sold to students without trying to hoodwink them, or can shoes, diasale of health knowledge is just as much a commodity as the ones mentioned, and the man who does not sell a good commodity eventually finds himself in difficulties A man can be honest to the last letter while following the business of a doctor, but he will have trouble

with patients at times

He quotes that now threadbare statement that the family doctor is passing out of existence. That is non-sense There never was a time when the man of knowledge concerning health and disease was so much sought after by the heads of responsible families. The old type of doctor, call him what you will, who came in with a wise crack, a sense of profundity, and left the patient dying of appendicitis, mastoiditis, typhoid fever, or something else, is passing out, and it is a mighty good thing that such is the case. If the new men entering medicine do not take to their offices the facts of health and disease, and apply them through the use of their ingenuity, the people will hunt some one for their medical adviser, who will deal in applied medical science. Relations are closer between patients and doctors today than ever Can a man be trained in all of the methods by which medicine is taught today, including a liberal education in the arts, without being able to quickly get to the mind of a patient? If he can't, he is a failure to begin with, and needs to take a course in salesmanship and histrionicism. A little bit of these two arts will help in getting nearer the spot. The old doctor got within about a mile of the patient, and two miles from the diagnosis. But after all patients come to a doctor to be examined, treated if possible, or cured if possible, and not to love the doctor, or to be made love to The sort of thing the Professor is talking about left the whole United States sometime about 1914

Violent exception is taken to the statement that doctors do not want to see the world freed of disease. All of the important progress that has been made in modern medicine primarily had its inception in doctors, and most all of the really important measures of preventative medicine came from the minds of doctors, and not from the minds of pharmacologists, and public spirited citizens Doctors will keep the world free from disease as soon as it is made possible to cure or prevent all disease. Doctors do not keep people sick. We are

begging for cures

The life of Percival is discussed It is neither interesting nor important, but is used by the author to get in his heavy firing squads. The Professor fails to remember that a man who would be dishonest with a

patient under his care, would be dishonest as a broker, banker, storekeeper, or even as a pharmacologist. Just because one happens to be a doctor proves nothing about his morals, doctors are made of the same warp and woof as the rest of mankind, and sometimes one gets the impression that it is all a sorry mess course, it is to be admitted that the section of the code which prevents one doctor from telling of the mistakes of his brother might be differently interpreted. Where would the people get if they were told that the previous doctor had made a mistake, and they are told it often enough, but usually it is to get business, and not to alleviate their suffering They would get no place. The medical profession is an automatic exchange bureau, the good is given for the good, and the bad covered up by the good. It is the way of all life. So long as the ignorance of the people is as it is, there will be no difference, because the people are too stupid to know the difference between good philosophy concerning health, and the reverse. Medical students are too mexperienced to know when professors of pharmacology hand out information that is useless, and the "dear public" gets one put over on it because of these teachings. The professor can take a few of his criticisms home to himself, as his branch of the teaching staff is employed and paid by donations and taxations to find cures, and the mortality tables of the United States are here to prove that they have been very poor in their responses to the demands The practitioner is the retail merchant for the things, which the state or private donations pay to these discoverers of cures to develop

The author is also keen for the so-called public spirited men, who start clinics at a cut rate price, and pay doctors very small salaries to work in them The doctors are a part of the general public. No one gives the general public free shoes, free gasoline, free oil, free rent, or lends money without interest. The doctors are for fair play, and will stand as much physical punishment in the struggle for existence as any others. Doctors object to the forces, that reduce the general public to a state of poverty, attempting also to reduce them to the same state. Let the public spirited citizen pay his employees sufficient salary for them to live on and employ their own doctor, and the doctors will take care of their end of the problem. The public spirited citizen would then not get so much publicity. His hyprocrisy would be more obvious. One trouble with the doctors that he allows himself to be made a prostitute of from is that he allows himself to be made a prostitute of from the time he enters school until he goes to the grave. Let him learn that he is engaged in a great business of first importance to all people, and conduct himself in the same way that all other great business people con-duct themselves, and much of the criticism against him will disappear, and he will cease to be an object of charity from his less self-sacrificing business brothers

The professor probably has not visualized what would happen to himelf if the students that he and his ilk instruct were to be graduated to become \$3500 a week workers in the mills which he admires so much Men would stop studying medicine, and become public spirited men by going into the oil business, or something equally as smooth He would find himself reduced in salary, and if he is not unlike most of these noble people who teach us things, he is probably clamoring for more salary as often as there is a chance for him to be heard, so that he is really swallowing his own tail. The sons of Wisconsin are much tamer than the country would indicate, otherwise he would not write such a book.

The Code of Ethics of the American Medical Profession is included in the book. It might be improved on,

For Complemental Feeding

Prescribe

ANY Pediatrists advocate regular complemental feedings for the breast fed infant. They find that this relieves the strain upon the mother, prolongs the nursing period and has an excellent effect upon the weight and general nutritional condition of the child. Such a procedure also minimizes the difficulties attendant upon eventual weaning.

Dryco is ideal for use in conjunction with breast milk. The special drying process renders the formation of thick, tenacious curds impossible, eliminating digestive and nutritional disurbances. Free from pathogenic bacteria, the use of Dryco avoids milk-borne infections.

OUR NEIGHBORS

HEALTH EDUCATION OF THE PEOPLE

The New England Journal of Medicine of October 18 contains an article on Health Education of the People by Dr W G Ricker, Secretary of the Vermont State Medical Society, given before the New England Medical Council The following extracts show the trend of the doctor's remarks

"The teaching must carry facts of definite Let us use the cancer question for illustration We have here an abundance of funds clamoring to be used and we have a plentitude of willing publicists, we have a subject that certainly is a timely one, but we lack one We are not able to tell any one how to control the disease We are not able to show that we have an accurate means of diagnosis of the precancerous state, we cannot show that we can always be sure an abnormal condition is cancer in time to be of any value The theories are valuable and doubtless are leading to a solution of the problem incident to this disease But these theories are too deep for popular interest Their intrinsic value goes unappreciated 'What can we do to be saved' is the popular cry, and the present answer does The public are asking for bread not satisfy and too often are getting a stone Why should the medical profession give the greatest publicity to the disease of which they are the most ignorant? And why make ourselves ridiculous by calling every wart and wen a potential cancer when popular experience teaches the contrary? I am not opposed to cancer publicly as such but even a good thing can be over-done

"Many of our highest type of physicians and one at least of our insurance companies are promoting the periodic or annual health ex-It is true that this system will amination discover many latent and otherwise unknown cases of cardio-renal breakdown, but what is to be offered to the patient after the discovery? The public are not foolish and are well aware that as long as an individual feels well he is not sick and it is hard work to convince the average man that he should spend from five to fifty dollars to be told either that he is all right or that he has something that is going to show up in a few years and kill him and that he must quit work and liquor and go South in the winter and play only 18 holes of golf every other day, etc, etc, and that if he does all these things the disease will get him just the same

"Topics of general interest should be taught by mass methods, but not every health topic

is a general one Many are individual problems and general advice is not applicable. Individuals must be taught to have faith in their medical adviser and the doctor must conduct himself so as to deserve this confidence. All instructions must be accurate and truthful It will do no good to call a spade a shovel, and it adds nothing to popular welfare to exaggerate minor evils. If the medical profession will assume the task of public health teaching and will develop an eagerness to impart this knowledge, ways and means will suggest themselves Simply seize each and every opportunity to supply this knowledge where ever it is found A conversation here, a public talk there, newsprint and magazine articles with an eye always open and looking for an opportunity will accomplish much with persistence'

The paper was extensively discussed, all the speakers agreeing that physicians are in duty-bound to be the leaders in popular medical education. Dr. Wheeler said

"There is no class of men anywhere who have such an opportunity to influence public opinion as the physicians We are called into a family in cases of illness. The head of that family or the two heads of that family have absolute confidence in us or we would not be called in a case involving life or death should at such times improve the opportunity to explain to the people some of the things medicine has accomplished This should be done in a diplomatic way with no attempt to belittle any of the cults, etc, but simply to give the people a better understanding of what medicine has achieved in the past and what it is striving for in the future. Doctors are very derelict in this duty and are extremely loath to appear in any public way in defense of their own profession

"We must educate the members of the profession themselves as to what their duties are and make them appreciate the necessity of taking advantage of every opportunity they may have of explaining to their patients and the public the truth regarding any question that may come up regarding their profession. In this way the attitude of the public on all medical matters will be a much more intelligent one and they will be better able to act in a manner conducive to their own good"

Dr Birnie said

"In Massachusetts we have had practically no constructive legislation with regard to med-

(Continued on page 1449-Adv xv)

(Continued from page 1446)

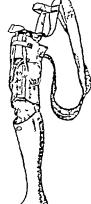

kal matters in the last ten years. Nearly everything that we have proposed has been defeated and nearly everything which we opposed has been passed We do not know how to accomplish our ends Possibly we must first instruct the public. When the public really becomes aroused and wants something it gets it As I understand it, the Registration Bill in Connecticut was put through by laymen and not by doctors, although it had the sanction of the medical profession When the public of Connecticut became thoroughly aroused they stepped forward and demanded relief which was given them We have had, in the past fen months, in Massachusetts, meetings for the public in regard to cancer and tuberculosis and possibly some of you may have attended meetings of this sort. The attendance by the public was extremely small and possibly disheartening to the speakers, but I do not know as you can blame the public. Who wants to give an entire evening to some subject in which he is not particularly interested. The public is interested in medical matters only if it is personally affected In addition, it is difficult to get a medical man to express himself in a form that is understandable and interesting to the layman I have been impressed by a number of articles published in the Saturday Evening Post written by 'So and So' as told to 'So and So' In other words the story or facts are contributed by an authority but put into popular and interesting form by an expert wnter I know from my own personal experience when sitting waiting for dinner, if I see a short article in the newspaper which looks interesting I read it In this way if the articles are authoritative, it is possible to absorb a considerable amount of knowledge at odd moments

"In order to get the public to read such articles on medical subjects, it is necessary to stress the interesting side rather than the scientific side, but the science can be there It is almost impossible for a doctor to talk in ordinary lay terms, and scientific material does not interest the public. There must be some appeal The medical facts may be furnished by medical authorities but the articles themselves should be handled by feature writers I do not know just how this can be brought about but it seems to me that the thought may be worth something"

Dr Rowley said "When the public, including the legislators, fully understands what is best for its own good, the legislation that will help bring that about will surely follow, and the corollary is equally true that attempts on our part to foster legislative matters that are

Are you taking advantage of Knox Sparkling Gelatine—

a valuable dietary adjunct for diabetic patients?

BECAUSE plain unflavored gelatine blends perfectly with all fruits, vegetables, meat and fish, it is ideally suited to lend variety and palatability to the diabetic diet Portions too small to serve alone can be made into satisfactory dishes with the addition of Knox Sparkling Gelatine

With Knox Sparkling Gelatine a number of pleasing variations can be introduced into the diabetic diet—dishes that have high protein or fat value, are appetizing, and impart a sense of satiety to the patient. Made plain and pure—unbleached, without flavoring, coloring, or sugar content, Knox Sparkling Gelatine is an ideal food for the purpose These qualities, also, make it a desirable means of lessening the monotony of liquid and soft diets in general

In infant feeding, the protective colloidal ability of Knox Sparkling Gelatine in overcoming imperfect milk digestion has long been known Exhaustive tests have proved that the addition of 1% of pure, unflavored gelatine to cow's milk tends to prevent regurgitation, gas, colic, diarrhea, and malnutrition In fact, Downey has demonstrated that the addition of gelatine increases the available nourishment of milk mixture, by about 23%

Knox Sparkling Gelatine is manufactured by a concern with 40 years of

experience in making this one product. From raw material to finished product, every step in its manufacture is under constant chemical and scientific control. The most sanitary conditions prevail throughout the factory

Valuable booklets on dietetics available

The booklets included below have been prepared by recognized dietetic authorities. They contain important data on the use of Knox Sparkling Gelatine in the various diets, together with recipes for a variety of tempting, appetizing dishes Surgeons, doctors, dieticians, and members of hospital staffs will find them valuable references Check those you would like to have and mail us the coupon.

CAUTION!

Arr. gelatines are not alike Many have added and flavoring and coloring matter. In the form of ready prepared desserts, they contain as high as 85 per cent carbohydrates.

Knox Sparkling Gelatine is a protein in its purest form, particularly suitable where carbohydrates and acids must be avoided it contains more than 80 per cent pure protein (4 calories per gram)

Specify Knox when you prescribe gela tine and you will protect the patient from brands unsuitable for his dietary purposes.

one of the regular society programs, promoted employment of public health nurses, conducted weekly health columns in new spapers aided in diphtheria immunization cooperated with parent-teacher associations in the summer round up examination, endorsed and actively participated in the Christmas seal sale, made use of its members as a speakers bureau on public health subjects, and interested itself in various community health projects such as milk inspection, bovine tuberculosis eradication, the early diagnosis campaign and health work in schools

In more than a dozen counties of the state doctors are officers of county public health associations organized under the auspices of the Iowa Tuberculosis Association. In nearly half the counties there is at least one doctor on the executive committee of such association. In one county all the doctors and two of the dentists at the county seat are members of such committee.

For many years past the State Society through its trustees or other governing body has endorsed the annual Christmas seal sale conducted by the Iowa Tuberculosis Association and local health associations In so doing it has recognized the possibilities of mutual helpfulness between the organized medical profession and a voluntary association in which both doctors and laymen participate medical profession can render to such a voluntary health movement certain definite services Among these are furnishing the scientific basis for the public health program and continuous advice as to policies Another valuable service is public speaking and no doctor should hesitate for reasons of professional reticence to give to the public at the request of public health workers that accurate information which he alone possesses This idea has been approved by the Council of the State Medical Society and not only have they recommended this speaking service to local physicians, but they have started plans for organizing a statewide speakers' bureau

On the other hand a voluntary agency can render services to the medical profession. It can carry on educational and preventive campaigns which the medical profession would hesitate to promote under its own auspices. It can direct to the attention of people the necessity for periodic medical examination. Last spring the Iowa Tuberculosis Association and its local units conducted a state-wide campaign as part of a national movement whose key notes were "Go to your Doctor" and "Let your Doctor decide". In matters of legislation and community organization such a volun-

not clearly understood are almost sure to meet with failure until such time as the people become convinced that the movement is of vital importance to their welfare and is not some trick that the doctors are trying to put over in their own selfish interests. The daily newspapers might be used more extensively than they have been in disseminating medical information with the censorship of the local med-The frequent articles in the lay ical societies magazines and the wide distribution of Hygeia have no doubt accomplished much, and in time their influence and that of similar agencies will count for still more Time, patience and perseverance must be had in carrying on a work of such magnitude

DOCTORS AND LAYMEN IN IOWA

The November Journal of the Iowa State Medical Society contains the following editorial résume of the cooperative activities of doctors and layworkers in Iowa —Editor's note

Be it resolved by the Council of the Iowa State Medical Society that members of the Society should take an increasing part in all public health work, and especially in all lay organizations having to do with public health, prevention of disease * * *

In theseCunequivocal words the Iowa State Medical Society on September 22, 1928, put in its platform the planks of preventive medicine and educational public health work action together with previous steps taken in setting up a full time executive department through which the Society could cooperate with all state-wide movements established the medical profession of Iowa in the forefront of progressive groups throughout the country working for community betterment

This was a long step forward in enabling the medical profession to assume that leadership in public health movements to which because of its knowledge and equipment it is rightfully entitled

In a number of counties physicians have for several years been active in public health When the National Conference movements of Social Work met in Des Moines, Dr John H Peck was asked to present a paper on such At his reactivities of the medical groups quest the publicity committee of the conference sent a questionnaire to county medical The replies of seventeen sosociety officers cieties showed considerable activity along pub-They showed that the county lic health lines societies had done one or more of the following things held tuberculosis and heart clinics as

dent will litter inform you of teamsive plans proposed for the farme development and observations in post-gradients medical work in the State. Also as an evidence of the increasing interest in medical courses and their probable effects upon the fature ment of medical protice attention is called to the substance of a resolution offered at the last American Medical Association by our Senior delegate. Or Leight and which was endorsed by the Council on Medical Education and Hospital as follows:

1 That it would be desirable that medical stricts should graduate and enter practice at an earler age than at present:

2 That the plan of covering the medical course in three years of four quarters instead of in four years of three quarters, or any other accounte plan for reducing the length of the medical course, is greatly to be desired:

3 That the medical course is overcrowded with details and with detailed consideration of specialities and would be improved by less crowding with a course confined more nearly to the essentials, and that efforts to this end should be made.

These and other facts that might be adduced, show in part, the dissatisfaction prevailing in the profession, and the spirt of unrest among the laity brought about principally, because of the conditions and restrictions now governing medical courses and hospital training schools

MEDICAL AND LAY HEALTH WORK IN KNOXVILLE

New York is not the only State in which lay organizations have undertaken unwise health work, and physicians have asserted their leadership in all forms of the practice of medicine. The City of Knovville, Tennessee, has been the scene of such a contest, which is described in the following extracts from the Illinois Medical Journal for October—Editor's Note.

"Prior to the recent adjustment of public health and clinical activities in the City of Knox-rille, there existed conditions involving a degree of conflict between the voluntary health agencies, the public health authorities and the medical profession such as are more or less common to many American municipalities

"As in most instances, the Knoxville situation was developed from a total disregard by the voluntary health agencies, and to a lesser extent by the official health body, of the interests of the medical profession in the formulation of plans for public clinics. Here, as is quite commonly the practice, programs for clinical procedures

tary organization can help to safeguard the interest of the medical profession indirectly while promoting directly the best interests of the people at large Obviously these interests are identical

In a direct way the Iowa Tuberculosis Association may be of service to physicians by offering literature on heart disease and other subjects, by offering the services of examiners in chest diseases for county medical programs, by participating in promotion of such projects as the post-graduate course held last summer, by collecting statistics, by publication of a monthly magazine on public health and by legislative, educational and publicity work

GRADUATE MEDICAL EDUCATION IN VIRGINIA

The November issue of the Virginia Medical Monthly contains the following report which the Committee on Medical Education made on October 16 to the Council of the Medical Society of Virginia—Editor's note

Plans for making available extension courses for physicians unable to leave their practice have been in operation now for several years North Carolina in 1916 was the first State to

organize under the auspices of the State Board of Health, the local Medical School and the University of North Carolina. The itinerary system was adopted. The expenses of the organization were borne by the University and the State Board of Health, while the salary and traveling expenses of the instructors were paid by local physicians of each center in towns from 1,500 to 50,000 population.

This work has been continued to date, and has been carried on with gratifying success, forty to forty-five per cent of physicians in active practice at designated centers attending the series of twelve lectures, at a tuition cost of \$30 00 for each physician

This plan with various modifications has been adopted now by nine other States, but it is probably true that New York, which organized Extension Graduate Courses in 1922, has done more than any other State to raise the local standards of general practice

Recently, also, the Albany Medical College has determined to increase its post-graduate facilities, and to this end has raised the sum of \$3,000,000 00 so as to render country practice more attractive. In addition to this, it has established a department for the regional extension of medical practice, which is virtually a "clearing house for communities in the State needing physicians, and for physicians seeking locations"

Looking towards the same end, your Presi-

(Continued on page 1453—adv xix)

(Contract from gage 1454—abr. su)

to harmonious action and a larger measure of real service to the public."

Appended to the description were letters from officers of the Knex County Medical Society describing conditions in the Red Cross Clinic. It is gratifying to note that the plan proposed by the physicians was adopted, and that the clinic and teach tentre are now under the direction of the doctors.

MEDICAL RELIEF IN NEW JERSEY.

A society for the Relief of Widows and Orphans of Medical Men has existed in New Jersey for forty-five years. The annual report of its Board of Trustees as printed in the September Journal of the Medical Society of New Jersey, says:

"In the year just completed nothing unusual or of serious moment to the Society has transpired.

"It is a matter of gratification that we are steadily growing: 32 new members were elected and as only 1 dropped for nonpayment of assessments and 2 resigned, we can record a present membership of 523. Nine members died.

We are now paying for death benefit a little over \$-00 and at the December meeting \$550 was distributed to beneficiaries, who were deemed to be in need of assistance. Our Permanent Fund now amounts to \$40,719.86 and our income therefrom for the past year was \$1,959.55. To many of our members this amount seems very large, and they question the wiscom of accumulating such a sum, or of increasing it. Really, however, when the size of the Society is properly considered the amount is trivial, in its ability to extend aid to our beneficiaries.

All that we can give in the way of death claims is 75% of the amount collected from the last assessment, and if it is desired to increase this amount some other plan must be devised but always without impairing the Fund or diminishing the percentage which should make for its normal increase. It is possible that some such plan may be arranged Your Board is carefully considering the matter and it may be that by an additional voluntary contribution from members or friends, another and distinct Fund might be created from which moneys might be granted to living members who are in actual need."

were set up by a lay group according to its own conceptions of service, without proper knowledge or regard for the needs of such services and without the guidance or advice of the medical profession through the agency of its local society. The medical profession was consulted only after all other plans for service had been made ready and when medical skill became essential to further functioning Then the doctors were asked to contribute their professional services for the care of clinic patrons, but the doctors were not accorded the right to determine clinic policies, especially those relating to the determination of a patient's eligibility for free service. The patient's financial status and right to free service was determined by the lay officials who were actuated largely by a desire to make an attendance record for the clinic The service was operated on this basis for some months

"As a result of these mistaken policies, the clinic became a source of contention and eventually was forced to close through withdrawal of

all medical forces from the staff

"For the adjustment of the matter the American Public Health Association, then as now, engaged in the study of local health and clinic operations with a view to their placement on a well-approved and harmonious basis of operation, was invited to survey the situation and present a plan for future operation. The assignment was given to Dr. C. St. Clair Drake of Illinois, attaché of the American Public Health Association in this field of special service.

"The outcome of the studies were

"(a) The transfer of all clinics, excepting tuberculosis and other clinic services of a strictly public health character, to the city hospital under the direction of the medical staff,

"(b) The organization of a medical advisory board of five members, two nominated by the medical society, to assist the local health officer

in an advisory capacity,

"(c) The erection of a Citizens' Health Council to serve as an agency to harmonize the activities of all voluntary and official health activities with those of the medical profession, and

"(d) The housing of all public health agencies, official and voluntary, in a "health center" under the coordinating direction of the city health officer who, as previously stated, acts in harmony with the decisions of his advisory boards, medical and lay. Here also are maintained such clinic activities as are mutually agreed to as essential to proper public health functioning

"To date, this plan of organization appears to be operating satisfactorily. It affords that contact between the public health group and the medical profession that is indispensable to a proper mutual appreciation of each other's services and to a conduct of activities in such manner as leads

A TEST FOR LEAD ABSORPTION

The count of basophilic cells per cubic millimeter of blood is described as a test of beginning lead poisoning according to an editorial in the Journal of the American Medical Association for July 28, which says

"In normal persons the number of basophilic red cells per cubic millimeter of blood may vary widely As a rule it is less than 1.000, and in the 145 normal adults examined it never exceeded 5,000 The pathologic states in which the number of basophilic cells is increased are as follows lead intoxication, benzene poisoning, arsenic poisoning, all types of anemia in which there is regeneration, hemolytic icterus, the condition following hemorrhage, leukemias, acute infections, neoplasms involving the bone marrow, and polycythe-Frank lead poisoning produces counts almost invariably over 7,000 and rarely over 100,-000 Usually in lead poisoning the number of basophilic red cells per cubic millimeter falls between 7,000 and 50,000 Signs and symptoms of clinical lead poisoning may not appear even when the basophilic cell count is as high as 60,000 or 80,000 The investigation has shown that many office workers and others who, although engaged in lead industries usually are considered as unexposed, nevertheless may absorb much lead and thus may be in danger of developing clinical lead poisoning The practical conclusion is that when a worker who is exposed to lead develops a basophilic red cell count in excess of from 6,000 to 7,000 and when other conditions which might produce such a count are absent, that worker should be considered a lead poisoning prospect and treated accordingly"

HUMAN RABIES IN MASSACHUSETTS

The New England Journal of Medicine of September 27 contains the following editorial comment on a case of human rabies and the failure of the physician to prevent the development of the disease—Editor's note

Another death from rabies has occurred in Massachusetts The boy was bitten on or about August 4th The physician who first treated the case rather belittled the lacerations, while the descriptions from the parents would make one feel that thy were extensive over the arms and face Local treatment of the wounds only was given during the five days that the boy was under observation On September 17th the boy was taken to the hospital with some doubt as to the diagnosis This was finally made and confirmed by examination of the brain

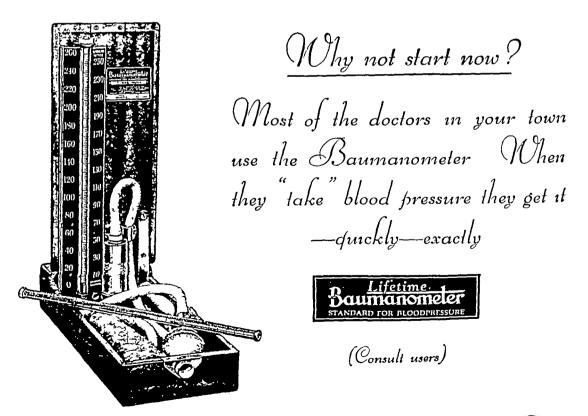

The doctor first seeing the case states that he called a general hospital and was told that they had no material for prophylactic inoculations on hand. He also called the police and received no information from them regarding the dog. He then states that he pushed the

matter no further because he had no information about the dog. In view of the fact that Massachusetts communities have demonstrated their lack of interest in controlling this disease through restraint of dogs, the lavish use of Pasteur prophylaxis is the only protection against increased deaths from this disease. The law authorizes local boards of health to spend money for "necessaries for the safety of the inhabitants" so that there is no excuse for the least delay in administration of these inoculations for economic reasons

The Department of Public Health has recently declared all dog bites reportable. Up to now only dog bites which in the opinion of the physician were sufficiently serious to require Pasteur treatment have been so reportable. From experience in this case it would seem that the judgment of the physician is not sufficient and that for the present emergency, at least, all bites must be reported.

Comment on the situation in connection with the recent death would seem to be unneces-

PURPURA AND PLATELETS SOME PRACTICAL CONSIDERATIONS* By KENNETH R. McALPIN, M D, THE PRESBYTERIAN HOSPITAL, NEW YORK CITY

"Purply and the sublowed, besides, many excellent contributions have recently appeared on this subject
which may readily be found by those interested

This paper will be limited to the briefest possible discussion of diagnostic methods and a more detailed account of the technique of

platelet counting

In his recent article Rosenthal covers the whole blood picture of the various forms of purpura very thoroughly, he also subdivides the condition into groups. At present no attempt will be made to consider any but the "Purpura Hæmorrhagica," or "Thrombocytopenic Purpura."

It should be borne in mind that this same picture may arise as a result of several different diseases such as leukemias, septicæmia, and Rosenthal has reported it in Banti's and Gaucher's disease, Hemolytic Icterus, Pernicious Anæmia, Tuberculosis, Carcinoma, Typhoid fever, and as the result of some drugs

Before making a diagnosis of Purpura Hæmorrhagica, such predisposing factors should be ruled out because it can readily be seen that the consequences may be most unfortunate if, for example, the patient has the spleen removed and then it later appears that the purpura was due to leukemia or a blood To rule out some of these stream infection disorders may at times test the diagnostic skill of the physician or surgeon. This brings up the importance of a careful history, which is of value not only to rule out some causative factor but also to indicate whether the malady is acute or chronic If acute, the prognosis is, of course, much worse and surgery is contraindicated Most of the cases will give a history that is suggestive, if not definite, there will usually have been some bleeding, perhaps which, of course, may not be significant har more important is the bleeding from the mucous membrane and a tendency to bruise easily, while excessive menstruation in a female may be due to a hæmorrhagic tendency

Abdominal cramps may be so severe as to suggest a surgical condition, and undoubtedly such cases have come to operation Bleeding from the rectum is a most valuable diagnostic

sign

Sometimes these people will say that they bruise easily but on closer questioning it will be evident that black and blue spots appear without trauma. The small petichiæ, except when very numerous, will be overlooked by all but careful observers

The early diagnosis is of tremendous importance because it is always possible that the next hemorrhage will be in the cranium

with unfortunate results

If the history is at all suggestive there are a few observations which, when taken together, will be helpful in coming to a definite conclusion

- 1 Bleeding time, is prolonged, sometimes tremendously
- 2 Clotting time is little if any prolonged

3 The clot does not retract

4 The tourniquet sign is positive (a tourniquet placed on the arm or leg for a few minutes will cause a large black and blue area) Rosenthal¹

5 Blood platelets are markedly reduced or apparently absent Whipple?

When there is any history of bleeding or of purpuric spots and the platelets are low purpura hæmorrhagica is to be seriously_considered. Such an assumption puts a great-burden on the one who counts the platelets, and as this procedure is not without complications some time may perhaps be devoted to the technique of the actual method. No new solutions or methods will be advocated, simply the details will be taken up and some of the more usual errors discussed.

There are a great many different solutions und methods. Some have special advantages,

VALUE OF NUIOL FOR OIL **ENEMAS**

In cases of acute constipation, or under special conditions where it is important to secure thorough evacuation of the bowels with the least effort, enemas are advisable. Most doctors today favor the oil enema, in preference to the other well-known types of enema such as hot soap suds and water, hot saline solution, glycerine, etc., for the oil has a soothing, healing effect on the membranes

Until recently the oil used for these enemas has been chiefly olive or other vegetable oil These oils, however, have certain distinct disadvantages, for they are likely to undergo fermentation and become rancid More than that, they encourage bacterial activity in the colon As olive or vegetable oils are absorbable, these bacteria are also absorbed into the system to the same extent that the oil is

These dangers and discomforts may

be entirely avoided by using a fine grade of mineral oil like Nujol Doctors who have experimented with Nujol find that it has all the advantages and effectiveness of the olive or vegetable oil enema, and has none of its disadvantages, for Nujol is a pure mineral oil. It is not a fat, so cannot become rancid or undergo fermentation It is not absorbed. Every drop of it passes out of the system, and with it any harmful bacteria that may be present. In this way there is no possibility of any unpleasant after effects

The most successful way to administer such an enema is to inject the Nujol at bedtime-anywhere from 4 to 16 ounces, depending on conditionsand have it retained until morning. It combines readily with the fecal matter, softens and lubricates it, and makes an easy thorough bowel movement.

It is important that only a specially purified refined mineral oil should be used for these enemas Inferior grades are likely to produce nausea That is why Nujol is specified by so many doc-It is of the very finest quality, tors absolutely pure, and with just the right specific gravity and viscosity to make it most effective. The Nujol Laboratories have the services of highly trained petroleum chemists, perfected manufacturing facilities, and a background of experience in the manufacture of petroleum products unequalled anywhere in the world See advertisement—Adv

BREAKING THE HABIT

Sufferers from chronic constipation are usually addicts to the cathartic habit They try one remedy after another, and as frequently as not one physician after another, with perhaps, temporary relief, only to relapse at the first sign of costiveness into the old way of a pill or two every night.

In such cases it is important to break the habit, mentally as well as physically, so that the patient does not expect a return of his ailment and try "a new pill" at the first sign of "costiveness"

The logical bowel corrective is Agarol, the best mental corrective a simple explanation of the essentials of a "corrective" as exemplified by the composi tion and action of Agarol

The three factors involved are

1 LUBRICATION BY MINERAL OIL-to smooth the intestinal walls. easing the passage of impacted fecesand, perhaps, absorbing some bacteriaessential for normal action but insuffi cient alone, since it has no positive ac tion

EMULSIFYING THE OILS WITH AGAR-AGAR-to segment the feces, and thus prevent impaction, so that with the establishment of normal fecal consistency natural peristaltic ac tion may be aided

3 A PERISTALTIC STIMULANT PHENOLPHTHALEIN" - which will induce reactivation of the fatigued intestinal musculature, and gradually restore normal evacuation

Samples of Agarol can be obtained on request, from William R. Warner and Company, Inc -See advertisement page 1x-Adv

WHY DRY MILK?

The production of clean milk is engaging the attention of health authorities to a greater extent than ever be-fore. The heavy toll in lives which liquid milk has taken in the past and is still taking, notwithstanding many regulations and inspections by Health Departments, has called for efforts on the part of all milk producers to reduce this milk hazard

In 1893 pasteurization was first attempted Pasteurization has done much to eliminate milk-borne infections However, in order to be safe, milk must be carefully pasteurized and health authorities everywhere are taking steps to see that the pasteurization is carefully This, of course, involves carried out the human equation, and there are records of many epidemics caused by milk supposed to have been pasteurized in which pasteurization has been faulty --Adv

PURPURA AND PLATELETS SOME PRACTICAL CONSIDERATIONS* By KENNETH R. McALPIN, M D, THE PRESBYTERIAN HOSPITAL, NEW YORK CITY

"PURPURA" is far too important a subject to attempt to cover in the time allowed, besides, many excellent contributions have recently appeared on this subject which may readily be found by those interested

This paper will be limited to the briefest possible discussion of diagnostic methods and a more detailed account of the technique of

platelet counting

In his recent article Rosenthal 1 covers the whole blood picture of the various forms of purpura very thoroughly, he also subdivides the condition into groups. At present no attempt will be made to consider any but the "Purpura Hæmorrhagica," or "Thrombocytopenic Purpura"

It should be borne in mind that this same picture may arise as a result of several different diseases such as leukemias, septicæmia, and Rosenthali has reported it in Banti's and Gaucher's disease, Hemolytic Icterus, Pernicious Anæmia, Tuberculosis, Carcinoma, Typhoid fever, and as the result of some drugs

Before making a diagnosis of Purpura Hæmorrhagica, such predisposing factors should be ruled out because it can readily be seen that the consequences may be most unfortunate if, for example, the patient has the spleen removed and then it later appears that the purpura was due to leukemia or a blood stream infection To rule out some of these disorders may at times test the diagnostic skill of the physician or surgeon This brings up the importance of a careful history, which is of value not only to rule out some causative factor but also to indicate whether the malady is acute or chronic If acute, the prognosis is, of course, much worse and surgery is contraindicated, Most of the cases will give a history that is suggestive, if not definite, there will usually have been some bleeding, perhaps which, of course, may not har more important is the

VALUE OF NUJOL FOR OIL ENEMAS

In cases of acute constipation, or under special conditions where it is important to secure thorough evacuation of the bowels with the least effort, enemas are advisable Most doctors today favor the oil enema, in preference to the other well-known types of enema such as hot soap suds and water, hot saline solution, glycerine, etc., for the oil has a soothing, healing effect on the membranes

Until recently the oil used for these enemas has been chiefly olive or other vegetable oil These oils, however, have certain distinct disadvantages, for they are likely to undergo fermentation and become rancid More than that, they encourage bacterial activity in the colon As ohve or vegetable oils are absorbable, these bacteria are also absorbed into the system to the same extent that the oil is

These dangers and discomforts may

be entirely avoided by using a fine grade of mineral oil like Nujol Doctors who have experimented with Nujol find that it has all the advantages and effectiveness of the olive or vegetable oil enema, and has none of its disadvantages, for Nujol is a pure mineral oil. It is not a fat, so cannot become rancid or undergo fermentation It is not absorbed. Every drop of it passes out of the system, and with it any harmful bacteria that may be present. In this way there is no possibility of any unpleasant after effects

The most successful way to administer such an enema is to inject the Nujol at bedtime—anywhere from 4 to 16 ounces, depending on conditionsand have it retained until morning. It combines readily with the fecal matter, softens and lubricates it, and makes an easy thorough bowel movement.

It is important that only a specially purified refined mineral oil should be used for these enemas Inferior grades are likely to produce nausea That is why Nujol is specified by so many doctors It is of the very finest quality, absolutely pure, and with just the right specific gravity and viscosity to make it most effective. The Nujol Laboratories have the services of highly trained petroleum chemists, perfected manufacturing facilities, and a background of experience in the manufacture of petroleum products unequalled anywhere in the world See advertisement-Adv

BREAKING THE HABIT

Sufferers from chronic constipation are usually addicts to the cathartic habit They try one remedy after another, and as frequently as not one physician after another, with perhaps, temporary relief, only to relapse at the first sign of costiveness into the old way of a pill or two every night

In such cases it is important to break the habit, mentally as well as physically, so that the patient does not expect a return of his ailment and try "a new pill" at the first sign of "costiveness"

The logical bowel corrective is Aga rol, the best mental corrective a simple explanation of the essentials of a "corrective" as exemplified by the composition and action of Agarol

The three factors involved are

1 LUBRICATION BY MINERAL OIL-to smooth the intestinal walls, easing the passage of impacted fecesand, perhaps, absorbing some bacteriaessential for normal action but insuffi cient alone, since it has no positive ac fion

EMULSIFYING THE OILS WITH AGAR-AGAR-to segment the feces, and thus prevent impaction, so that with the establishment of normal fecal consistency natural peristaltic ac-

tion may be aided
3 A PERISTALTIC STIMULANT = "PHENOLPHTHALEIN" - which will induce reactivation of the fatigued intestinal musculature, and gradually restore normal evacuation

Samples of Agarol can be obtained on request, from William R. Warner and Company, Inc.—See advertisement page ix-Adv

WHY DRY MILK?

The production of clean milk is engaging the attention of health authori ties to a greater extent than ever be-fore. The heavy toll in lives which liquid milk has taken in the past and is still taking, notwithstanding many regulations and inspections by Health Departments, has called for efforts on the part of all milk producers to reduce this milk hazard

In 1893 pasteurization was first attempted. Pasteurization has done much to eliminate milk-borne infections However, in order to be safe, milk must be carefully pasteurized and health authorities everywhere are taking steps to see that the pasteurization is carefully carried out. This, of course, involves the human equation, and there are rec ords of many epidemics caused by milk supposed to have been pasteurized in which pasteurization has been faulty --Adv

PURPURA AND PLATELETS SOME PRACTICAL CONSIDERATIONS* By KENNETH R. McALPIN, M D. THE PRESBYTERIAN HOSPITAL, NEW YORK CITY

"PURPURA" is far too important a subject to attempt to cover in the time allowed, besides, many excellent contributions have recently appeared on this subject which may readily be found by those interested

This paper will be limited to the briefest possible discussion of diagnostic methods and a more detailed account of the technique of

platelet counting

In his recent article Rosenthal 1 covers the whole blood picture of the various forms of purpura very thoroughly, he also subdivides the condition into groups. At present no attempt will be made to consider any but the "Purpura Hæmorrhagica," or "Thrombocytopenic Purpura"

It should be borne in mind that this same picture may arise as a result of several different diseases such as leukemias, septicæmia, ind Rosenthali has reported it in Banti's and Gaucher's disease, Hemolytic Icterus, Pernicious Anæmia, Tuberculosis, Carcinoma, Typhord Iran.

phoid fever, and as the result of some drugs Before making a diagnosis of Purpura Hamorrhagica, such predisposing factors should be ruled out because it can readily be seen that the consequences may be most unfortunate if, for example, the patient has the spleen removed and then it later appears that the purpura was due to leukemia or a blood stream infection To rule out some of these disorders may at times test the diagnostic skill of the physician or surgeon This brings up the importance of a careful history, which is of value not only to rule out some causative factor but also to indicate whether the malady is acute or chronic If acute, the prognosis is, of course, much worse and surgery is contraindicated Most of the cases will give a history that is suggestive, if not definite, there will usually have been some bleeding, perhaps which, of course, may not Far more important is the

State of New York at Albany N Y May 22 1928

bleeding from the mucous membrane and a tendency to bruise easily, while excessive menstruation in a female may be due to a hæmorrhagic tendency

Abdominal cramps may be so severe as to suggest a surgical condition, and undoubtedly such cases have come to operation Bleeding from the rectum is a most valuable diagnostic

Sign

Sometimes these people will say that they bruise easily but on closer questioning it will be evident that black and blue spots appear without trauma. The small petichiæ, except when very numerous, will be overlooked by all but careful observers

The early diagnosis is of tremendous importance because it is always possible that the next hemorrhage will be in the cranium

with unfortunate results

If the history is at all suggestive there are a few observations which, when taken together, will be helpful in coming to a definite conclusion

- 1 Bleeding time, is prolonged, sometimes tremendously
- 2 Clotting time is little if any prolonged

3 The clot does not retract.

4 The tourniquet sign is positive (a tourniquet placed on the arm or leg for a few minutes will cause a large black and blue area) Rosenthal¹

5 Blood platelets are markedly reduced or apparently absent Whipple?

When there is any history of bleeding or of purpuric spots and the platelets are low purpura hæmorrhagica is to be seriously considered. Such an assumption puts a great burden on the one who counts the platelets, and as this procedure is not without complications some time may perhaps be devoted to the technique of the actual method. No new solutions or methods will be advocated, simply the details will be taken up and some of the more usual errors discussed.

There are a great many different solutions and methods. Some have special advantages,

but they also have the disadvantage of being too complicated for routine clinical use or the solutions are not stable. Some of the best known are Rees and Ecker, Buchman and Hallisey, Gram, and Kristenson. The Wright and Kinnicut method seems to have two drawbacks, the red cells are destroyed and it is very difficult to know whether the preparation is accurate or not, there is nothing to focus on but the platelets and if these are scarce much time will be lost

It must be borne in mind that there is no wish to criticise any of these methods, it is quite possible that excellent results may be obtained with any or all, but for practical purposes the method of Ottenberg and Rosenthal has been found satisfactory, not only because of the results obtained but also because of ease of preparation

This is simply a 3% Sodium Citrate solution which must be freshly prepared and filtered just before using. It is advisable to make up only a small amount and not attempt to keep it over night. A convenient way is to weigh out several one-half gram lots and store in bottles until required, then add sixteen and a half mills of distilled water. If the water is freshly distilled so much the better. A stain may be used but is not necessary

The rest of the equipment is as follows High dry lens No 8, or Zeiss No D Blood counting pipettes 1/100, the so-called "red cell" pipette, (if these are standardized it will tend to inspire a feeling of confidence)

Inasmuch as the platelets are small and colorless it is most important to have everything scrupulously clean. More than once an unsuspected dust particle has masqueraded as a platelet

The blood is obtained in the Technique usual way, from the finger or ear It is destrable to have a free flow and to avoid squeezing With as little delay as possible the blood is drawn up to the mark "5", and the citrate to "101" This gives a dilution of 1 to 200 stronger solution cannot well be counted because of the red cells The pipette is shaken for at least one minute and then the drop is placed on the counting chamber The disappointments attending this step are said to be second only to those experienced by those who sought perpetual motion The chamber should be well filled as it is allowed to stand for at least 10 minutes,-Buchman, advocates 15 This is a long time to wait and it minutes is convenient to have two counting chambers so that while waiting for one to settle the second may be filled. Now the preparation is ready and the platelets will be found to be small, colorless bodies of approximately one-

third the size of a red cell Before attempting to count a case of suspected purpura, it might be well to have a little practice on blood that is known to be normal It is a poor sport looking for platelets in blood where they are practically absent Careful focusing is essential and here the red cells are a most kindly aid, they are also of value in indicating that the preparation is reasonably accurate Often the platelets clump together in great masses and the integrity of the observer is sorely tried as it is about as possible to count correctly under such circumstances as it is to make a reliable determination as to the number of bees in a swarm Even under such trying circumstances one thing is proven, namely, that platelets are present and in large numbers. In some institutions it is customary to throw out any preparation which contains large clumps This is possibly an ethical as well as technical problem The counting is exactly similar to the method of enumerating red blood cells, but as a higher power lens is used the danger of getting lost in the field is infinitely greater It is well to count a whole millemetre, which is quite a job, but by so doing the error will be somewhat reduced. If the dilution is 1 to 200, the depth of the counting chamber onetenth millemetre, obviously the factor will be At least two preparations should be examined and better, four In a normal count of 300,000, one would find 150 platelets in a millemetre It is easily seen, then, how great an error may creep in when only a few of these tiny objects are overlooked, or perhaps counted when they are not present. It is to be regretted that there are instances (that do not appear in the literature) where wee specs on the glassware have carefully been recorded as platelets in good and regular standing. Hence, in addition to a freshly prepared and filtered solution, a personal acquaintance with the counting chamber is to be recommended

If one wishes, a stain may be used, but it is doubtful if the assistance given is in proportion to the added difficulty of washing the pipettes and counting chambers. When present in reasonable numbers there is no difficulty in recognizing the slightly yellowish little bodies that have a great tendency to clump together. These little fellows will be found, as the focus is varied, to be in turn quite transparent, faintly yellowish and also refractile. If there are numerous wee objects on the field which are always opaque, one is most probably not dealing with platelets.

This tendency to vary when examined with different focuses curpliances in a maple not only of allowing the preparation ample time to settle, but also the necessity of a very nice adjustment of the light. When there is

too much light, no platelets will be visible, and when not enough the observer's eyes will soon

fall by the wayside

The errors in platelet counting are probably due, in a great measure, to ignorance of the appearance of a platelet, and also to the fact that the observer expects to find "something," in large numbers, so with more enthusiasm than accuracy he proceeds to find some little black spots that look sufficiently like what he has in his mind's eye, and he proceeds to carefully enumerate dust particles, yeast cells and miniature oil droplets All little round objects, seen when using a sodium citrate soution to dilute blood, are by no means platelets red blood cells are again decidedly helpful, as here one has something of known size to judge by It is a good practise to examine the solution to be used without blood. It is surprising how many pseudo-platelets are often found Platelets are not mobile and except when settling they should be quite stationary reasonable to suppose that most beginners will count high just as in the case of red or white cell counts Apropos of this, the average observer will have a tendency to count high or lon, but this tendency or error will be a constant rather than a variable one, so in the long run such an error will not be of any great significance, provided that the counting is done by the same person on several different occasions A single platelet count is certainly better than none, but the value of two or more is proportionately much greater

From what has been said, it would seem that the technique of platelet counting leaves much to be desired. This is undoubtedly true and even in the most skilled hands there will usually be a wide range of variation, but this does not vitiate the value of such examinations,—it only means that a variation of a few thousand is not to be taken too seriously. When a novice is making the examinations, he should do several on successive days and if he finds too startling a variation, the difficulty may be elsewhere than in the patient's hæmotopoetic

system

The method of estimating the number of platelets from the smear is all right in the hands of the expert but dangerous for others, as there is an undoubted tendency for platelets to gather near the edge. Piney advocates counting the number of platelets in comparison to the red blood cells. This is more accurate but rather time-consuming and not altogether satisfactory.

Dr A O Whipple removed the spleens of the following five cases of purpura hæmorrhagica (thromocytopenic purpura) in the Presby terian Hospital and they are referred to here with his permission. Three of the cases have been described in detail by Dr. Whipple else-

where All of the platelet counts were done by the author

Inasmuch as this paper deals primarily with blood platelets, the following cases will be discussed as briefly as possible and no other details will be considered

General condition is much better Patient is still convalescing at home

SUMMARY

- 1 Accuracy in counting blood platelets depends, to a great extent, on practice and attention to details, many of which are apparently trivial
- 2 Five cases of purpura hæmorrhagica, four of which were women, had the spleen removed After the operation all showed a rise in platelets, but the highest was only 180 000, the next 100 000
- 3 Of these patients one died twenty months after operation He appeared to have had a cerebral hemorrhage, not an unusual

mode of exitus in purpura, very impressive as he had appeared to have made a perfect recovery. His platelets, however, after a preliminary rise had never approached normal limits.

- 4 Of the other four cases all are living, well and active at two and a half years, three years, and two years, respectively, after operation. The remaining case is still convalescing from the operation.
- 5 No explanation is offered to account for the lowness of these counts, which tend decidedly lower than most observers report. Nor do these cases seem to bear out the accepted idea that the higher platelet counts indicate a better prognosis. The only fatality was the case with the highest count. This may well be a coincidence, but it is worthy of note

Discussion

Dr Stillman I wish to endorse all that Dr McAlpin has said concerning the difficulties of making satisfactory platelet counts. There is one additional difficulty which has bothered me at times and that is the tendency for preparations in the new style counting chambers to evaporate and so distort the results. This can be avoided either by placing the counting chamber under a cover together with some water so that one has a wet chamber, or by going back to the use of the old style counting chamber in which the cover glass completely closes in the preparation

I feel that the absence of clumping is a more important feature for correct platelet counts than apparently does Dr McAlpin Certainly, a preparation in which clumps are absent is theoretically much more accurate I also feel that the study of the stained blood film is of great help in platelet counts in two ways. In the first place it is possible to tell from an ex-

amination of the blood if the platelets are greatly reduced and secondly, in cases of purpura hemorrhagica one almost invariably finds abnormal varieties of platelets present in the smear, so that a study of the morphology of the platelets adds some little evidence to the information that is desirable in making this diagnosis I have always been very much impressed with the apparent fact that although a deficiency in the platelets is practically essential in making the diagnosis of purpura hemorrhagica. Nevertheless, they seem to have very little to do with the cause of the sypmtoms of this condition The change that takes place in the condition of these patients when the spleen is removed is immediate and exceedingly striking, indeed, it is said that the bleeding time becomes normal immediately upon ligation of the pedicle of the spleen tainly, the number of platelets cannot possibly be involved in this reaction and furthermore, when the operation does result beneficially, these patients remain symptomatically well no matter what their platelet count may be

I wish also to endorse heartily, Dr McAlpin's remarks concerning the inadvisability of splenectomy in the acute forms of this disease

Dr Gorham I feel that Dr McAlpin has made a very important contribution to this program I only wish I could have heard this talk two years ago when Dr Hunt and I

thought we knew something about platelet counting and found out that we didn't. We finally concluded that the nearest approach to accuracy could be reached by controlling it with smears made on very clean cover glasses. We have made literally hundreds of platelet counts when we thought at times we had reached an accurate number it was a wrong count. Dr. Gorham gave several accounts of patients he had treated and how their platelet count went up with violet ray treatments. Also after an operation the platelet count went up in most patients.

Dr Ordway Dr McAlpin kindly sent me his complete paper, so I had an opportunity to go over it very carefully and I heartily agree with all that Dr McAlpin has said in his frank discussion, and will merely emphasize certain points that he has said and add a word of caution as regards diagnosing diseases

It is of the utmost importance that a correct diagnosis be made of a disease at the earliest

possible stage of its development

A word about pernicious anemia Blood transfusions used to be the method of treating this but now the violet ray is used Transfusion however is the most important measure in getting a patient ready for operation

Repeated frequent infusions of blood instead of transfusions are often helpful Splenectomy should be reserved always for chronic cases

REPORT OF A CASE OF PURE RESPIRATORY DEPRESSION TREATED BY ALPHA-LOBELIN, A CLINICAL EXPERIMENT

By HYMAN SNEIERSON, M D., BINGHAMTON, N Y

RECENT literature has several articles on the use of Alpha-Lobelin as a respiratory stimulant. An article in the Lancet, December 18, 1926, gives the pharmacology of the drug but no experiments were made on man. In regard to this point, I should like to submit the following case as an interesting clinical experiment.

A H, age 67, a night watchman for the D L & W Railroad This patient was admitted to the Binghamton City Hospital, October 3, 1926 at 8 45 P M in coma No history was available, save that he was found unconscious in his room with a bottle of laudanum beside him. On admission, he was seen to be an emaciated white man, his face pallid and death-like, his mouth gaping open. At irregular intervals, he gave a deep spasmodic gasp. Both eyelids were open and the eyes diverged. The pupils were pin-point and fixed. No signs of

paralyses or injuries were noted. The limbs were flaccid The reflexes could not be obtained The pulse was of good quality—strong and regular The rate was 120 As near as could be estimated, the respirations averaged 2 a minute The blood pressure was 70 systolic with a diastolic of 40 The heart was enlarged to percussion with the apex beat best heard in the 6th interspace in the anterior avillary line The second sound over the apex was indistinct. The aortic second was also faint. The lungs were essentially negative Pressure over the supra-orbital nerves caused no response The temperature was attempted to be taken by axilla and rectally, but the thermometer would not register even after 5 minutes

External heat was applied and at 9 10 P M, 7½ grains of caffeine sodio-benzoate were given subcutaneously, but without any apparent effect. We had received some ampoules

104

of Alpha-Lobelin a few days previously and so 1/20 of a grain was given intravenously at 9 15 P M, the pulse and respirations being carefully noted The pulse was 100, respirations 2 An apneic period of over a minute occurred, the pulse dropping to 36 The patient then began breathing, Cheyne-Stokes type. This gradually became more regular At 9 30 P M, his respirations were 18 a minute, snoring in character, his pulse being 120 coffee was given by rectum at this time skin became warmer and his color somewhat The respirations gradually deimproved creased, however, until at 10 00 P M, they were 8 a minute—Cheyne-Stokes type pulse was 100 No further medications were given until 10 30, the pulse and respirations remaining as stated above The rectal tem-

perature taken at this time was 96

Delighted with the apparent response to the drug, we gave him a 1/40 grain subcutaneously at 10 30, which by mistake was repeated two minutes later—so that he actually received 1/20 grain. The results are tabulated below

Time Pulse Rate Type Medication 10 30 104 8 Cheyne-Stokes Alpha-Lobelin gr 1/20 128 subcutaneously at 10 30 10 34 3 ** " 10 37 128 6 24 10 40 8 128 10 45 112 10 10 48

The patient's condition did not show the improvement noted after the first injection of the drug. His nose and ears became cold At 10 36 Alpha-Lobelin was given again intravenously. The results are charted below

Passientinna

Time	Pulse		туре Туре	Medication	
P M					
10 36	100	8	Cheyne-Stokes	Alpha-Lobelin gr	1/20
10 57	78		(t (f	intravenously	
10 58	100	20	regular		
11 05	120	16	u		
11 11	116	12	11		
11 16	114	6	Chevne-Stokes		

The patient's general condition seemed better, however, and it was deemed safe to do a gastric lavage at 11 45 P M Soda bicarbonate was used and a large quantity of foul smelling brownish-green fluid with much mucus and a few solid particles, the nature of which were not determined, was obtained Four ounces of black coffee were left in the stomach patient roused up during the procedure and resisted, rendering it necessary that he be held He mumbled a few words, but paid no atten-Soap suds enemas tion to questions asked were then given until the returns were clear His condition remained the same until 1 30

At 1 30 A M, his respirations dropped to 5 a minute Alpha-Lobelin was given intravenously—gr 1/20 Respirations ceased for 64 seconds and then gradually increased to 19 per minute with a pulse of 120 At 3 45 A M, his respirations had gone down to 7, but they gradually picked up again

At 6.00 A M, his respirations were 18 and regular and his general condition much improved He was able to answer questions and said that he had taken laudanum, but denied that his condition was due to this as he had taken only a teaspoonful He denied taking any liquor

The patient's condition remained unchanged during the morning. In the afternon, he had several attacks of respiratory depression. At 7 30 P M, his respirations were 12, his pulse At 9 15 P M, his respirations were 2, his pulse 100 A hot coffee enema was then given, but without any apparent effect. At 1 10 A M, his respirations were still 2, spasmodic in character, his pulse 116 Several doses of strychnine sulphate, gr 1/40 were given during this time At 1 20 A M, caffeine sodio-benzoate, gr 7½ were given Respirations were still 2, pulse 104 At 1 45, Alpha-Lobelin gr 1/20 was given intravenously Respirations ceased for 40 seconds and then increased to 8 a minute, pulse 120 His general condition remained the same until 7 20 M, when he again showed respiratory depression, his respiration dropping to 3 was again given a hot coffee enema and a gastric lavage performed At 9.00 A M, Alpha-Lobelin was given intravenously with an almost immediate increase of respirations to 5 and a slight improvement in his general condition This was repeated at 10 40 12 noon his respirations were again 2 a minute At 1 20 another 1/20 grain of Alpha-Lobelin was given with some slight improvement. At 4 30 P M, his respirations were 6, pulse 108

No more Alpha-Lobelin was given, but coffeine sodio-benzoate, gr 7½ was given at 7.25 P M, his respirations being 6, pulse 100, with some improvement in his general condition At 1.00 A M, this was repeated without effect. The patient died at 1.10 A M. The original diagnosis of laudanum poisoning was changed to cerebral hemorrhage, probably pontine.

This case is reported as an unusual one in that it showed almost a pure respiratory depression enabling us to see the effects of the drug on this system. It is interesting to note that a response was elicited every time, but that this was less each time. However, inasmuch as the patient was suffering from an irremediable condition we believe this to have no significance.

This paper makes no pretence of being a complete scientific dissertation, and therefore explanations as to the exact action of Alpha-Lobelin are left out. All that we can say that in the light of the data compiled in this case,

Alpha-Lobelin may be considered to be a respiratory stimulant

THE EPIDEMIOLOGY OF AN OUTBREAK OF ILLNESS DUE TO MILK* By FRANK W LAIDLAW, MD, MIDDLETOWN, N Y

Monday, beginning at about one o'clock PM, seventy children were taken suddenly ill at a certain school in the district. The symptoms shown by all consisted of severe abdominal pain followed by violent vomiting. Marked prostration followed the vomiting which continued, in some instances, until the vomitus consisted of bile. In some instances diarrhea occurred that night or the next day. The children were out of school following the attack for periods of one day to a week, the average time being two or three days.

Between ten and eleven o'clock, eighty-two children and at least one teacher were served with milk. Seventy of these children and one teacher constituted the number taken ill. Water and milk were the only common factors. Water could not be expected to produce this type of illness, and is dropped from consideration.

Therefore, the milk served between ten and eleven o'clock constitutes the hypothetical cause, which we proceed to investigate

The milk was labeled "Raw Grade A" Ninety-five half-pint bottles were delivered to the school that Monday morning. It was served to the children in the original bottles, with soda straws

It was ascertained at the dairy that milk drawn from the cows Sunday night was used for the milk supply of the school

The dealer supplied about one hundred and fifty families, restaurants, etc. It was thought that no illness occurred except at the school Therefore, a comparatively small amount of milk must have been involved

The milk was cooled in forty-quart cans, consequently it appears probable that but one can was involved. Ninety-five half-pint bottles were delivered to the school. This would not use the entire contents of a forty-quart can. The remainder of that can must have been distributed to other

customers, so there must have been other cases among the customers besides the school. To settle this point, a canvass was made by a public health nurse of the customers of this milk route. Thirteen cases similar to those at the school were found to have occurred among those customers. This gave a considerable degree of foundation to the theory that one can of the Sunday night's milk was involved.

A microscopic examination of a sample of the milk served to the children showed the presence of numerous streptococci and pus cells. The bacterial count was 780,000. The most likely cause of such a condition involving one can of milk was a suppurative condition affecting probably one cow.

A State Veterinarian made a physical examination of the herd of forty-two cows. One was found with a chronic mastitis involving one quarter. The milk from this quarter, when allowed to stand, deposited a white sediment, while the supernatent fluid was lemon yellow in color. Pus cells and streptococci were abundant. The count from this quarter was 230,000. That of the other three quarters was comparatively low.

It was ascertained that the proprietor attended to the milking of this cow himself, but on account of having company Sunday night, he did not go to the barn, and the probability is that a careless farm hand milked the cow and added the milk from the defective quarter to the can of milk from which the school supply was bottled

In addition to the foregoing, it was ascertained that a farm hand drank some of the same milk as delivered to the school, and he became ill in the same way

There have been two other similar outbreaks investigated in the State, with the same findings We have described this rather fully in order to illustrate the line of reasoning followed. The "guessed at" explanation was that the milk had been "poisoned," a theory still cherished by some of the people of that community.

THE NERVE SUPPLY OF THE TRANSVERSE SUPER-SYMPHYSEAL INCISION By DAVID W TOVEY, MD., FACS, NEW YORK, N Y

not to injure the nerves supplying or crossing the cut structures Since much nerve injury predisposes to hernia by causing paralysis of muscle and atrophy of tissue from disturbed nutrition and loss of sensation I believe that the non-union of abdominal incisions, opening of the wound and the extrusion of the intestines is due to trophic nerve interference due to nerve In these cases there are no signs of tissue Staton, of Syracuse, in a tabulation of results following the vertical incision in ten representative hospitals of the East showed 2 to 10 per cent of hernia in clean cases

The nerves concerned in the transverse supersymphyseal incision are the anterior divisions of the twelfth dorsal and the hypogastric branch of the first lumbar (Fig 1) The twelfth dorsal nerve leaves the spinal canal below the last dorsal vertebra and rib, running at first behind the psoas muscle and in front of the quadratus lumborum. It pierces the transversalis and passes

ILI OHYTOGAST

FIGURE I

Shows the nerve supply of the anterior abdominal wall below the umbilicus (Modified from Honget)

between it and the internal oblique two inches above the iliac spine in a downward and inward direction to the edge of the rectus where it pierces the sheath and runs behind it to about the middle of the belly of the muscle, pierces the muscle and the anterior rectus sheath, some branches becoming cutaneous and supply the skin below the umbilicus. It also supplies branches to the transversalis, the internal and external oblique, the rectus and the pyramidalis muscles

The hypogastric branch of the first lumbar nerve runs between the transversalis and internal oblique about an inch above the crest of the ileum, it continues downward and inward parallel to the twelfth dorsal, pierces the internal oblique about an inch in front of the anterior superior iliac spine and lies about half an inch above the inguinal canal under the aponeurosis of the external oblique, pierces the aponeurosis of the external oblique an inch and a half above the external inguinal ring, becomes cutaneous and supplies the skin above the pubes below the level of the twelfth dorsal. It gives off branches to the transversalis, oblique, and pyramidalis muscles.

The ilio-hypogastric is not usually seen in the transverse supra-symphyseal incision as it pierces the external oblique above the external ring and is retracted with the lower flap. At times muscular branches to the rectus are found when the lower flap is retraced. All the anterior divisions of the lower dorsal and first lumbar nerves are double, each nerve supplying a definite section of the abdominal wall.

In the transverse supra-symphyseal incision after the aponeurosis has been separated from the rectus muscles, the linea alba is divided and (Fig. 2) the upper flap retracted sometimes four large nerves can be seen coming through the recti about half an inch from the median line and piercing the anterior fascia These are the anterior divisions of the twelfth dorsal nerve They are often half as thick as a match, double, and accompanied by a blood ves-(Fig 3) They should not be cut, as in retracting the upper flap they can be drawn out sufficiently in nearly all cases If scissors are used to separate the sheath from the rectus muscle, these nerves may be mistaken for connective tissue and cut. I think this will account for some of the cases of hernia that have been re-I have never ported as following the incision seen a case of hernia with this incision twenty years I have demonstrated these nerves If looked for to the students at the Polyclinic they are seen in every operation

The upper part of the anterior division of the twelfth dorsal nerve in the oblique muscles is not seen and, if care is taken to split the o

muscles in the direction of their fibers, there is no danger of cutting it even with the extended incision used in large tumors When a very large

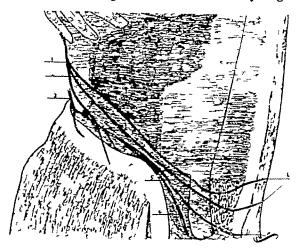

FIGURE II

The anterior divisions of the twelfth dorsal, the hypogastric, and the inguinal branches of the first lumbar (Adapted from Spatieholz) (1) 12th dorsal nerve, (2) in transversus abdominus, (3) ilio-hypogastric nerve (4) ilio-inguinal nerve, (5) in obliquous internus, (6) anterior cutaneous branches of 12th dorsal nerve

opening is required, the incision through the skin can be made from one spine of the ilium to the other. The incision through the aponeurosis is then prolonged over the lateral edge of the rectus muscles and the oblique muscles are split along the line of their fibers, if necessary out to the iliac spines. This gives an enormous opening. It is seldom necessary except in very large tumors.

The detachment of the aponeurosis from the recti is effected upward as far as the umbilicus, and downward as far as the symphysis. The pyramidali remaining upon the flap of the aponeurosis or on the rectii usually on the rectii and the rectii muscles are separated under one of the pyramidali and the peritoneum severed in the line.

The incision provides a very large opening suitable for the removal of the largest tumors and making it easy to operate deep in the pelvis. For a smaller opening, the incision is made in the pubic fold which occurs in all women that are at all fat. It should be made almost straight with only the slightest curve, not crescent-shaped as it is often described. In young women when

a small incision is all that is needed, the skin incision can be made below the line of the pubic hair, the skin and fat are then pulled up and the iponeurosis divided at a higher level. The skin or fat should not be separated from the underlying tascia. There is no danger to the bladder if the peritoneal incision is started high. In cutting toward the pubes, one knows he is near the bladder by the thickening of the fatty tissues 'pevisical fat' and the little bleeding

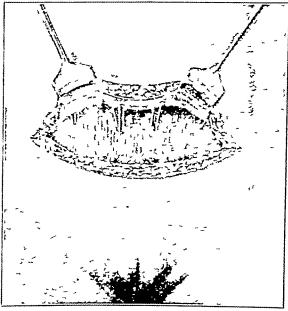

FIGURE III

Shows the musion with the anterior branches of the twelfth dorsal nerves, coming out from the rectus muscle and piercing the aponcurosis covering the muscle

It makes little difference points encountered whether the pyramidales are left attached to the rectus sheath, where they act as tensors of the fascia luiea alba, or are separated and left on the recti The peritoneum is entered at the outer side and under one of them Hemostasis should be carefully looked after before closing any incision, hematomata are apt to form if this is not done I use this incision for large tumors and in infected cases I find that it heals without danger of hernia even in the presence of infection The skin heals more quickly than the vertical inci-ion as the skin fibers run transversely, there is no tension Scars are often invisible

METHODS IN OBTAINING MILK CODE ADOPTION* (As Employed in Middletown, N Y)

By H J SHELLEY, M D., HEALTH OFFICER, MIDDLETOWN, N Y

ALTHOUGH the new State Milk Code is an innovation for the State at large, Middletown sometime ago anticipated it and had already prepared the producer, the dealer and the consumer to meet these changes. In fact, we might even say that this preparation began in 1906

In the summer of that year the Board of Health, because of the large number of gastro-intestinal diseases with a high mortality rate among babies, became much interested in better milk (Our infant mortality at that time was 145) After considerable investigation, the unsanitary conditions under which milk was produced and handled were concluded to be an important factor in producing these cases of illness Our first milk regulations were then passed governing the production and handling of milk and also requiring all milk sold in the City to be bottled

As you may guess, the farmers in the surrounding country were up in arms After many letters to the local press, barroom debates and livery stable conferences, it was duly affirmed that if the Middletown Board of Health persisted in enforcing these fool regulations, the farmers would trade elsewhere and the milk dealers would refuse to supply milk with the result that the sick would die, babies starve, and calamity cast a gloom over the City As a matter of history, on the date set for the enforcement of the regulations milk was delivered in bottles and the affairs of the City went on as usual This was put over without a hitch, but since that time any change in the milk regulations has been a matter of educating the public in advance

Coincidentally and probably as a result of the improved milk supply, the next summer saw a drop in bowel troubles in children accompanied by a lower mortality rate. This drop has been steady and in direct proportion to the improvement in methods of handling our milk, so that today gastro-intestinal troubles in children are a rarity. While other factors enter into the situation we claim our present low infant mortality rate of 45

to be largely due to clean milk

From a morbidity, mortality or economic point of view, clean milk pays and, if Middletown handicapped by lack of funds and by politics, can have good milk, other municipalities without these impediments can do still better work. If you give it a thought, there really is no other food as badly and carelessly produced and distributed as milk

Middletown continued with the 1906 regulations always having in mind the necessity of the gradual education of the public for better milk

* Read before the Annual Meeting of the Medical Society of the State of New York at Albany, N Y, May 23, 1928.

and showing the dealer how a cleaner and better product would sell for more money, and so on until the State Code of 1914 became effective. This educational program has been carried on by the health officer speaking before prominent clubs or organizations, taking women of the Federation of Women's Clubs to plants and farms, and by holding at least two smokers a year for dealers and producers. These get-together meetings have been the best method of helping the dealers and producers solve their problems as well as mine

While the Code of 1914 had not the radical change from dipped to bottled milk, still the grading caused considerable discussion among the producers and dealers as to fairness, et cetera, of the regulations But here again the dealer saw light for he could charge more for Grade A than B, especially was this true in the case of pasteurized milk for, as we know, in many instances there has been but little difference between these grades aside from the caps on the bottles The producer saw still more light for by fixing his milkhouse and barns a little and using small-top milk-pails, his grading being based largely on his dairy score, he could then make milk to be known as Grade A Pasteurized After a time these State regulations became quite popular, for many farms throughout the State are now classified as "Grade

It was a source of great pride to me as it was also to many other physicians in the city when, seven years ago, we were able to get a dairyman to introduce Grade A Raw Milk from Tuberculin-Tested cows and sell it for 16 cents a quart while other grades sold for 10 to 14 cents Believe me, it was some venture for us who were back of the idea My physician friends talked milk from tuberlin-tested cows to their patients and prescribed it. In order that it could be readily procured for babies, arrangements were made at a number of drug stores to handle the milk and it was delivered on telephone calls the same as a prescription

It was a great gamble and it meant advance or defeat in our good milk program. Today, that seems like a dream, for the milk from tuberculin-tested cows has gradually increased in sales so that all raw milk sold in Middletown is from this source. This result has been a matter of constantly educating that great triumvirate—the consumer, the dealer and the producer

Believing that all parties were coming to the point where it was possible, the Board of Health at my suggestion in January, 1927, passed a resolution (note this was a resolution) that on and after July 1, 1927, "all raw milk sold in the city should be from tuberculin-tested 1

cows" This brought out opposition from the local press and especially from a drovers' organization. This organization, officered and financed by cow dealers, put up quite a fight Some of the members of the Board of Health even were doubtful as to the expediency of the resolution, and a commercial factor became so

prominent that a number of the members of the board questioned my right to have brought about this change, claiming that the resolution passed only signified their intention Here was a time when a fellow needed a

friend I suggested that the board rescind their resolution and have the press headline its action to the citizens of Middletown. This was not done. The resolution stood like a red flag to a bull until a modification of the new State Code was passed in January, 1928, and became effective April 1, 1928.

I wish to say that now, however, before a regulation is passed by the board, a survey is made with the view of having a supply of milk at 12 hours' notice in case dealers or producers should strike and, incidentally drop a monkey wrench into the gear case. This I don't expect, but long years in public health work have taught me to be on the look out for the unexpected. This arrangement is known to the dealers and it helps considerably in my educational campaign.

As we near the top, we may be dizzy with Be this as it may, the new State Code has been in effect since April 1st with the following modifications As to grades, we allow Certified, Raw Grade A and Pasteurized Grade A with the same requirements as the State Code We allow only one grade of milk to be bottled at a plant I believe you can guess what a mix-up in milk there can easily be in a plant receiving milk from physically examined cows for pasteurization and milk from tuberculin-tested cows to be sold as Raw Grade A Some of the better grade might get into the pasteurizer but some of the poorer grade might get into Raw Grade A bottles,

Personally, I believe the grading of milk by bacterial count is much fairer to both producer and consumer than the former method of grading by the almost universally used dairy score card. And I believe that though the new code

also In forming your regulations, think this

is going to greatly increase the work of health officers, the end results will more than justify the labor involved Health officers are directed in the new code to do certain things, among which is the collection of body specimens from all milkhandlers Through the cooperation of Dr Paul Brooks, we had feces examinations of all milkhandlers from milkers to drivers Fortunately, no typhoid carriers were found this is, however, in a section that has been practically free from typhoid for many years 4 I believe this is the correct interpretation of the law and the right thing to do, but unless you have sufficient and intelligent assistance to put over the work, it will probably be better to confine your efforts to the suspicious cases only This would apply equally as well to the taking of throat cultures to find diphtheria carriers. Another point of great importance to the health officer is that under the new code he has practically the entire control of the milk sold in his district—but don't try and control that sold outside

While we are sitting pretty at present on the milk question, we are expecting opposition from the pasteurizing plant people for, after July 1, 1929, ALL milk sold in Middletown is to be from tuberculin-tested cows whether pasteurized or raw. At the present time, notwith-standing all arguments to the contrary, we see enough human element in the process of pasteurization for us to doubt it always being properly done and until this factor is overcome, we believe that milk from tested cows is the only safe milk to pasteurize

In milk questions as in all public health work I try to take the public into my confidence. There is hardly a week goes by but that a producer or a dealer comes into the office and makes suggestions. I always have a listening ear and oftimes the dealer or producer will go out and boost for me. As in all work of this kind education and cooperation are the most effective weapons and particularly is this true in regard to milk. In closing, never since November, 1906, have the people of Middletown been allowed to forget that milk is their problem and that they must pay the price to get the best.

Note Since this paper was read, a typhoid carrier has been found in a pasteurizing plant supplying Middletown

THE IMPORTANCE OF SOCIAL SERVICE AND CLINIC MANAGEMENT IN OPHTHALMOLOGICAL CLINICS

By MARY K TAYLOR AND CONRAD BERENS, MD, NEW YORK

A study of 1,346 records from five Eye Clinics in New York and Brooklyn, made for the Ophthalmological and Medical Social Service Sections of the Associated Out Patient Clinics Committee of the New York Tuberculosis and Health Association by Mary K Taylor, Secretary of the Medical Social Service Section, under the direction of Dr Conrad Berens.

Introduction

N 1922 a committee of ophthalmologists of the City of New York, organized as the Ophthalmological Section of the Associated Out-Patient Clinics,* instituted a number of studies of eye clinics, with a view to ascertaining conditions and developing desirable standards The study was made under the supervision of the committee by members of the staff of the Associated Out-Patient Clinics Fifty-two hundred records from five representative eye clinics were A report of the findings was published in The Modern Hospital, October, 1922, issue, Vol XIX, No 4 In brief, the findings indicated that there was no uniformity in the handling of records and the recording of data in the various clinics, that of 193 cases suffering from diseases that might cause blindness (19 diagnoses agreed on by the committee) 534 per cent attended the clinic only one time, that the records showed slight evidence to insure proper care to the patient beyond the filling of prescriptions for drugs and glasses, and very little appreciation of the need to protect other members of society from infec-On the basis of these findings the committee of ophthalmologists adopted recommendations that

Systematic follow-up to insure continued treatment should be instituted for certain types of cases with diseases that might cause blindness

Physicians should be responsible for seeing that the patient is informed of the nature of the trouble and the importance of treatment, and for deciding on what date the patient should return

The social service department with such clerical assistance as is necessary should note the name of the patient whose return is desired and through the proper methods should endeavor to

secure his return on the date specified

Four years after this study was made and the recommendations adopted, it seemed desirable to the committee of ophthalmologists that another study should be made to determine present conditions in eye clinics. This new study was made in 1926 under the joint auspices of the Ophthalmological and Medical Social Service Sections of the Associated Out-Patient Clinics Committee of the New York Tuberculosis and Health Association, and included five institutions in New York and Brooklyn

In brief, the new study showed that in institutions where the recommendations of the committee had not been carried out, conditions were similar to those which prevailed four years previ-Only 50 per cent of cases with diagnoses included in the list of serious diseases requiring follow-up attended the clinic more than once On the other hand, in the institutions where a systematic effort had been introduced to keep patients under treatment, with the assistance of a social worker, 80 per cent made more than one The new study includes refraction cases. and shows that much the same conditions pre-In the clinics where no systematic effort was made to keep patients under treatment only 52 per cent of the refraction cases finished their examinations and obtained glasses if prescribed, while in the other group 86 per cent of the refraction cases completed treatment and secured glasses prescribed

Findings of 1926 Study

Since this study brings out the contrast in results obtained by clinics where an effort is made to study the need of the individual patient and to control his attendance until treatment is completed and by those clinics where there is no such systematic effort, we shall present the statistics of the two groups separately. We shall hereafter use the term "case control" for purposes of brevity in describing that type of care which provides for individual handling, and the regulation of attendance

1 Conditions Which May Cause Blindness

Group 1—Three eye clinics without case control

Two hundred and six cases of conditions which may cause blindness occurred in this group † Of these, 122 (59%) made but one visit to the clinic, and 32 (16%) made but two visits. Only 9 (4%) made more than ten visits. One hundred forty-two (70%) were under treatment less than a week, 42 (20%) were under treatment more than four weeks. Only 9 cases (4%) were shown by record to be satisfactorily completed, 3 more (2%) were apparently still active (at the end of a year) making a total of 6% which definitely showed satisfactory accomplishment. Ten cases (5%) had lapsed. It was impossible to determine the disposition in 184 cases (89%)—

^{*}Executive Committee of the Section on Ophthalmology of the Associated Out Patient Clinics of the City of New York (1922): Walter E. Lambert, M.D., Chairman, Edgar S. Thomson, M.D., Vice-Chairman, Conrad Berens, M.D., Secretary, Ellice Alger, M.D. Isaac Hartsborne, M.D., Chairmers Jameson, M.D., H. H. Tyson, M.D., John M. Wheeler, M.D., Julius Wolff, M.D., Michael M. Davis Executive Secretary, Associated Out Patient Clinics Gertrude E. Sturges M.D., Assistant Secretary

^{*} Similar conditions evidently exist in other cities See "Aspects of Social Service and Preventive Work in Eye Hospitals" (New York State Journal of Medicine, September, 1921) and "Medical Social Service and Follow Up Work in the Eye Hospital" (Archives of Ophthalmology Vol XLIX, No. 5 1920) by Dr George S Derby of Boston.

most of these (with the possible exception of the cases with a diagnosis of "Foreign Body in Cornea") had undoubtedly lapsed, as the record indicated no apparent improvement, and there was no statement that treatment had been completed

Group 2—Two clinics with case control

Seventy-seven cases occurred in these two clinics Of these 25 (32%) made one visit, 11 (14%) made two visits (many of these one and two visit cases were satisfactorily completed by transfer, etc) Nine (12%) made more than 10 visits Twenty-one (27%) were under care less than a week-of which 8 were patients with foreign bodies The disposition of all the 77 cases was determinable-in one of the institutions the disposition was recorded on the medical record. in the other it was possible to determine it from the follow-up file kept by the social worker Thirty-seven cases (48%) were completed, 22 (29%) were still active at the end of a year—a total of 77% which were satisfactorily cared for Only 18 (23%) lapsed before treatment was completed

Comparison

The clinics in Group 2 (with case control) showed 29% less one and two visit cases, 8% more cases making 10 or more visits There was a gain of 43% in the number of cases kept under treatment more than a week, a gain of 31% in the number of cases under treatment more than There was a gain of 71% in the number of cases known to be satisfactorily completed or still active

Refraction Cases

Group 1-Three clinics without case control

In the first group of hospitals there were 353 refraction cases Only 52% of these completed the examination and obtained glasses prescribed Thirty-four per cent of those given drops to put in their eyes at home failed to return to complete the examination Of those for whom glasses were ordered at least 23% failed to secure them (Figures concerning the percentage not securing glasses are undoubtedly too low, as the information obtained from opticians, with the exception of one institution, was based on incomplete data) The large majority of these had failed to order

† Certam diagnoses not occurring in the 1922 study were classified by us and added to the list of diseases and injuries which cary cause blindness. The complete list used in 1926 as basis for statistics is as follows GENERAL Glaucoma.

CONJUNCTIVA Conjunctivitis Acute, Purulent (muco-puru lent) Pterygrum, Trachoma.

CORNEA Abscess, Foreign Body in Cornes, Keratitis Inter statial, Phlyctenular, Syphilitic. Ulcer LENS Cataract.

UVEAL TRACT General Diseases of Uveal Tract Uventis
Anterior Iris Iritis Ciliary Body Cyclitis, Choroid Chonoretinitis Choroiditis Central.

RETINA Retuits Hemorrhagic, Sy Retua, Thrombosis of Central Vein. Syphilitic, Separation of OPTIC NERVE Amblyopia, Atrophy EYEBALL Disorganized Globe (Phthisis Bulbi) Exophthalmos. DISTURBANCES OF MOTION Strabismus.

the glasses, very few failed to call for glasses on which a deposit had been made

Where revenue is derived by the institution from the sale of glasses the financial loss involved when only half of the refraction cases complete treatment and secure glasses is necessarily great

Group 2-Two clinics with case control

In the second group of hospitals there were 389 refraction cases Of these 86% completed the examination and secured glasses if prescribed Ninety-one per cent returned to complete the examination, of those for whom glasses were ordered 94% obtained them

Records

No adequate system of attendance-control could be built up on the basis of the records as kept by the hospitals in Group 1 The disposition was recorded on the medical record in only 9 cases On 127 out of 771 cases out of 771 (1%) (16%) there was no record of any advice or treatment having been given the patient. One of the hospitals in the second group also omitted disposition from the medical record, but it was possible to learn it from the social worker's clinic In only one institution was it possible to file learn from the medical record itself whether the patient had secured glasses In one the optical department of the hospital kept a file of patients who had received their glasses and the worker feels that her check-up was accurate others the method of finding out whether the patient had received his glasses was by elimination, if there were no unattached stub in a bale of stubs preserved by the optician or if there were no note to the contrary in the social worker's file, the patient must have received his glasses Since all the data collected by elimination presupposes that every case for whom glasses were prescribed was given a prescription to present to the optician, one must infer that even more patients failed to secure glasses than this study shows, as in one institution about one-third of the patients who did not order glasses apparently never even accepted a prescription

CLINIC MANAGEMENT AND SOCIAL SERVICE

What is responsible for the great difference in results obtained by these two groups of clinics?

We can at once disclaim that it is entirely the use of a mechanical letter follow-up system, since of 42 letters sent to request the return of lapsed patients 33, or 79%, were unsuccessful evident even in clinics where an effort is made to make the patient understand the importance of care that if he has once decided not to return the chances that a letter will bring him back are slight

Since it is evident that the sending of follow-up letters alone is not sufficient to secure the attendance of patients until treatment is completed, let us study the other features in the handling of patients in the two groups of clinics

Group 1—Three clinics without case control

Clinic Management

In this group there was no appointment sys-Lapsed cases were not reviewed or fol-It was impossible to tell from the records what disposition had been made of the cases Little systematic effort was made to make the patient appreciate the importance of return. The social worker was not present in the clinic and had little opportunity to discover and remove obstacles to the return of the patient or to his carrying out of treatment The doctors had the entire responsibility for discovering and referring to the social service department cases which they thought needed care, although occasionally administrative officers or opticians referred cases for financial adjustment This form of organization did not provide for attention to the individual patient, discovering his misunderstandings and fears, making sure that he knew what he was to do and that he could do it-in short, did not provide for attention to the social and psychological elements in the handling of patients in the clinics

Use Made of Social Service

In these institutions where no social worker was assigned for duty in the Eye Clinic, the Social Service Departments were called on to assist in the care of 7 patients out of 206 with diseases that might cause blindness—only 3% In 4 of these 7 cases the social service department was asked to adjust fees, in 2 cases follow-up was requested, in one case a report was written by the Social Service Department The department was in touch with 14, or 4%, of the 353 refraction cases Nine out of these 14 cases were referred for financial adjustments, in 3 cases reports were written, in 2 cases there was no record of what action had been taken

It is evident that these departments had very little opportunity to take part in the care of the patients

Group 2—Two clinics with case control

Clinic Management

In this group of clinics patients were given a definite return appointment. Lapsed cases were reviewed A record was made of the disposition of the cases A social worker (assisted in one clinic by a volunteer, and in the other by a clerk) was present in the clinic. Instructions given the patients were reviewed with them before they left, and the social worker talked over with each patient the recommendations which had been made, inquired into his ability to carry them out, reassured him as to adjusted payments if expense were worrying him, impressed on him the importance of return, and thus overcame in advance

many obstacles which might have prevented these patients from completing their treatment. This service of inquiry and instruction is required by nearly all patients. It worked well in these clinics to have it performed directly by or under the supervision of the social worker who was to handle the problems which were revealed by this inquiry or the adjustments made necessary by the treatment prescribed in the clinic

Services Rendered by the Social Service De fartment

In these institutions the social worker or someone directly under her supervision was in touch with all the patients and made sure that they understood the importance of care and were able to carry it out. Besides this service of inquiry and explanation, the social worker in one clinic found it necessary to make some social adjustment in the case of 29% of the patients, in the case of 17% more she found it necessary to write follow-up letters or make visits to get the patients to return and complete treatment. Two-thirds of the cases were undertaken for other needs than financial adjustment.*

Attention to the social and psychological elements in the handling of these patients in the clinic resulted in a much higher percentage of return, and also revealed needs of social treatment which might otherwise not have been discovered

Comparative Study of One Clinic

In order to make as accurate a test as possible of the results attained by installing a social worker in a clinic, comparative studies were made of one of the clinics in Group 2 before and after a worker was provided

Of the group of patients with serious conditions which might cause blindness who were admitted before a social worker was provided, 47% were under care less than a week. In the group studied after the social worker was assigned to the clinic, 20% were under care less than a week—and most of these were discharged or transferred to other care—a gain of 27%. Only 18% of such cases in the first group were known to have completed treatment satisfactorily as compared with 80% in the latter group—a gain of 62%. Sixty-seven per cent of the refraction cases in the first group completed treatment and obtained glasses if prescribed, as compared with 88% in the latter group—a gain of 21%.

It is evident that the introduction of a social worker into this clinic made it possible to keep more patients of all types under care until treatment was completed

^{*}We have outlined the essentials of a follow up system and a list of certain diagnoses which should serve as a guide to the hospital social worker and the ophthalmologist in selecting cases for special attention ("Social Service and Follow Up in Ophthalmology" Transactions of the American Academy of Ophthalmology and Oto-Laryngology 1926, and Hospital Social Service, August, 1927)

SUMMARY

- 1 It is important to note that 43% more of the patients with eye diseases which might result in blindness were kept under treatment more than a week in clinics where the recommendations made by the committee of ophthalinologists in 1922 were carried out and 71% more of these cases were shown by the records to be satisfactorily completed at the end of the year
- 2 Every ophthalmologist knows what this means to him in regard to his ability to follow the course of a certain disease and note the results of treatment. Unless he can do this and also draw conclusions in regard to the results of treatment, he is unable to use this material for research and teaching purposes It is a sad but true fact, brought out in this report, that very little use is made of the vast amount of material presented by several of our greatest institutions treating eye diseases in the City of New York, owing to the fact that the records are not only not properly filed and cross-indexed, but are actually so poorly cared for that the physician cannot be expected to take an interest in recording his findings
- 3 The fact that many of these patients will become blind if they do not attend another clinic or consult a private physician makes this a problem for the state and for the nation as well as for the individual clinic and the ophthalmologist
- 4 Not the least important point is the fact that much valuable time is lost by doctors and others upon those patients who make one visit and fail to return.
 - 5 Loss of time is also extremely important in

regard to the refraction cases, for without social service and follow-up work only 52% of refraction cases were found to be completed, whereas in the clinics where proper social service and follow-up were carried out, 86% completed their treatment and obtained the lenses prescribed

6 If physicians give their time gratuitously, they should have adequate clerical and social service assistance and if this were provided for refraction cases there is no doubt that the added revenue obtained by the hospitals would more than pay for the services of these workers

7 The question of the after-care and follow-up of surgical cases is also extremely important. If we are to draw any conclusions of value in regard to surgical procedure, it will be interesting to know from future studies the percentage of patients who fail to return after they are discharged from the hospital. The final results of operations can best be determined in clinics where social service is used.

8 Probably the most important point brought out in this study of clinical conditions is the fact that follow-up, in the sense of sending a card to a patient after he has left the clinic, is not sufficient. The entire handling of the patient from the time the patient is consulted at the admission desk must be such that the patient is impressed with the necessity of returning and is imbued with the idea that when he does return he will receive courteous treatment and conscientious skillful medical attention. It is clearly shown by this study that unless he is imbued with this idea, follow-up in the mechanical sense of the word will not improve conditions.

MEDICAL JOURNALISM

The time is past for questioning the value of the State Medical Journals, the tendency is in the opposite direction-to establish organs of County Societies Progress in state medical journalism during the past year is shown by the increasing employment of full time secretaries and editors who seize the suggestions

and inspirations afforded by every group of doctors talking shop Philosophizing on medical topics is the favorite avocation of physi-The medical journals which doctors seek the most eagerly are those which deal with local topics in a way in which doctors discuss them in their moments of relaxation

SENSITIZING COUNTY SOCIETIES

It is a significant fact that when a physician assumes office in the Medical Society of the State of New York and studies the problems which are referred to the society for solution, he becomes sensitized to the civic duties of the medical profession and begins to preach their performance Physicians have hitherto been concerned principally with the discovery of scientific truths and the methods of applying the discoveries to the treatment of sickness. But physicians realize their duty to give all kinds of medical service to all classes of people This is a broad program, and leads far beyond the private practice of medicine for which people are willing to pay, and into the fields of disease prevention and health promotion where medical service is impersonal and its performance is a civic duty that carries no financial remuneration and little honor

Many doctors profess to have no personal interest in the practice of public health and civic medicine, and at the same time they talk about the evils of free clinics and the abuses of pubhe health nursing, showing that their protestations of indifference are like the whistling of a boy passing a grave-yard The very fact that the doctors talk about the practice of public health by non-medical groups shows that they are deeply interested in the general subject. When a doctor's interest in any form of public health or civic medicine is aroused, either supporting or opposing, it is but a step to secure his participation in the activity Doctors are conscientious, and are jealous of the rights and prerogatives that devolve upon the medical profession of which each one is a member, be he an optimist or a pessimist If he should cast his argument in the ancient form of logic the doctor would reason

Major premise The medical profession is the source of knowledge and advice and practice in all medical matters

Minor premise I am a member of the medical profession

Conclusion Therefore I must be a willing source of knowledge and practice in public licalth and civic medicine

A physician must engage in some form of public health or medical civics in order to realize the extent of the civic obligations of the medical profession. A physician may not know whether he is sensitized or is immunized to the performance of his civic duties but he finds it out when the idea is introduced into his system of thought like very fact that a new idea enters the mind, induces a sensitization to that idea. A concrete example of developing that sensitization is the increasing interest which officers of the medical society of the State of New York take in the performance of the civic duties of physicians after they assume the duties of their position.

and further evidence is afforded by the continuance of their interest and their assumption of new activities after their terms of office have expired. Office holding in the medical society of the State of New York means willing service, with honor only incidental and secondary

When the idea of practicing public health and civic medicine is introduced into a medical society, some members may be found to be hypersensitive to matters which are associated with the practice and yet are foreign to it members must be desensitized, and the most practical way of doing it is by the introduction of the new theory and practice in small amounts for a brief period. When these physicians find that no evil effects follow the receipt of the idea, they become receptive to its practice and sup-An example is set porters of the movement forth in an editorial on page 1421 of the December first issue of this JOURNAL, describing public health nursing in a small city in which the hypersensitiveness of the doctors was changed to support when a discreet nurse came to assist the doctors in their private practice. A more recent example of that of the "resentment" of the physicians of a county medical society when the State Department of Health instituted a special survey of a part of the county The hypersensitiveness was to the foreign idea that the survey had already been fully planned by the State Department of Health when the county medical society was asked to participate in it The reaction of hypersensitiveness would probably have occurred in any event, but if the State Department of Health had introduced the idea some weeks before beginning the survey, the members of the county society would have recovered from the reactions and would have lent their assistance at once without complaint

Hypersensitiveness to constructive suggestions from the State Department of Health were usually expected and anticipated a decade ago, but its manifestations have occurred less and less often as the county societies have become desensitized to the extraneous ideas that often come with new movements in public health. The decreased frequency of the reactions is due to two reasons.

- 1 The activities in which doctors are expected to engage are now recognized to be those which are purely medical. Other groups and organizations will perform all duties along economic, social, and moral lines, and will leave all medical activities to the medical profession.
- 2 Physicians have always shown a normal sensitization to the performance of their medical duties along civic lines, and this reaction becomes transformed into constructive activity as soon as the physicians are given the opportunity to express it in a pure form

The story of the growth of the discharge of civic duties by physicians has been one of sensitizations and desensititions by both the medical profession on the one hand and voluntary organizations on the other, with the State Department of Health preserving some degree of neutrality There have been challenging chips on the shoulders of physicians, and volumes of propaganda put out by the lay health organizations, and out of it all has come the Committee on Public Relations of the Medical Society of the State of New York The great work of this Committee is to sensitize County Societies to their assumption of leadership in all activities relating to the practice The State has been divided into of medicine districts which has been assigned to the five members of the State Committee, as described on page

1432 of the December first Journal The plan of the Committee is to induce each county society to make a survey of the health activities in its county and to get in touch with the leaders in every line of health work. The object of each County Committee is to determine the health needs of the county, both public and private. The step that will naturally follow is that the physicians will assume the leadership in all forms of medical work in the County

The ideal result that may be expected from this plan of the Committee of Public Relations is that by common consent physicians will give or prescribe all forms of medical service to the people, while other organizations, acting in harmony with the physicians, will give all needed service along economic, social, and moral lines

NINETEEN TWENTY-EIGHT IN RETROSPECT

This Journal one year ago printed an editorial on "Mountain Peaks of Medical Progress," showing that every advance in the practice of medicine is initiated by a few leaders who raise an ideal like a mountain peak towering above the valleys and plains of ordinary practice. Then there follows the slow task of raising the level of common practice up to that of the peaks, until a high table land of practice finally envelopes the former mountain tops

The progress of the Medical Society of the State of New York during 1928 has consisted largely in elevating medical society practice up to the level of the ideal peaks set by a few discerning leaders. The specific evidence of the progress is that offered by the standing committees through which the State Society conducts the greater part of its work.

The three committees of Public Relations, Medical Economics, and Public Health and Medical Education, have functioned every day in the year, and their activities have touched nearly every member of the State Society

The arrangements for the annual meeting

have been placed in the hands of a general committee composed of members experienced in planning and conducting all phases of the yearly gathering. The Scientific Committee which provides the medical programs has already formed its tentative plans and laid them before the Executive Committee and the Council

While the work of the Committee on Legislation is largely seasonal, its method of influencing the legislative leaders has been immeasurably strengthened by its plan that physicians and medical societies shall approach their legislators through local civic organizations. The Committee on Research, like the Intelligence Department of the Army, has done much unheralded work in discovering the designs of anti-vaccinationists and others who would hinder medical practice.

The activity of all these committees is a reflection of the broadening and deepening interest and support of county societies and their individual members whose general standards of practice have risen above the peaks of the idealists of a half century ago, and will present ly submerge the present ideals

INDEX OF MEDICAL SOCIETIES ACTIVITIES

The index to the JOURNAL for the year 1928, Volume 28, contains the new feature of listing the records of the peculiar activities which belong to medical societies, in distinction from those belonging to individual physicians. Among those activities are the reports of officers and committeemen, anti-diphtheria campaigns, popular medical publicity, the establishment of county departments of health, the practice of the civic duties of the medical profession, and the leadership of doctors in their relation to voluntary health organizations.

The record of these activities of the societies is medical history in the making. It often rests in isolated paragraphs of the reports of officers, and remarks before the District Branches and County Medical Societies. For example, the best statement that has been made regarding the advertising policy of the Publication Committee is that opitained in brief remarks made by the Secretary of the Society, Dr. Daniel S. Dougherty, before the Sixth District Branch in Elmira, and recorded on page 1240 of the October 15 lournal

Another item is the summary of the controversy regarding the relation of the physicians of Cattaraugus County to the voluntary health agencies contained in the annual report of the Council, on page 494 of the May 1 issue of the Journal That controversy started like a cloud in the horizon, the size of a man's hand, and grew by almost imperceptible degrees until it became of national interest before those concerned were aware of its importance. If news items of this nature are indexed, even if they are short and seemingly unimportant, they become available to present workers and future historians

The value of the special index has been demonstrated during the past year by the requests of officers of the Society for a list of references which would be useful to them in planning their work The Public Relations Committee, for example, has found it of great importance to know

what have been the relations of physicians to ronmedical groups throughout the state

The index will also be of value to medical librarians as is indicated by an article on Indexing and Abstracting News Items in Medical Journals published on page 1165 of the October 1 JOURNAL

The record of the civic activities of medical societies is the field which is peculiar to state iournals Their record is not found anywhere else and yet it is of increasing value as physicians enter the more deeply upon their leadership in all medical affairs The Publication Committee and Editors of the NFW YORK STATE JOURNAL OF MEDICINE are planning the preparation and publication of a quarterly index of the practice of medicine by medical societies in order that the material may be available to all the officers of the societies of the state and the counties

LOOKING BACKWARD

This Journal Twenty Years Ago

State Medical Journals This Journal of December, 1908, contains an article by the editor, Dr J P Warbasse, on Medical Jour-

nalism, in which he says

"Most of the State journals do not aim to take a place among medical journals, but are more in the nature of bulletins of local medical progress New York can have either one a real medical journal or a bulletin of State affairs My own observation of the feeling of the profession in this State is that they would prefer that the State Society give them a well-rounded medical journal, partly supported by advertisements, and adding as much of local features as is not inconsistent with a good journal We, therefore, come back to the necessity of emulsifying the oily advertising business with the limpid waters of ethical purity

A real medical journal is not merely a bulletin of proceedings, or a catalogue of the activities of officials of local medical societies

"In a State having a well supported medical society, the profession may have as good a medical journal as they want, and its permanence of character can be assured It is simply a question as to whether they want it or not It is like politics, the people get about what they want and what they deserve an abundance of material for publication, and no dearth of good editorial talent. So far as material goes, in the case of the New York STATE JOURNAL OF MEDICINE, a journal four times its size could be issued. It is simply a question of wanting such a journal or not

The practice of medicine is a profession, celling drugs is a business. The standards of

one are not the standards of the other vertising in medical journals can not be made ethical from the professional standpoint and water will not mix So long as we publish advertisements there will be the eternal discussion of ethics. Nor does it apply to drugs There is just as much unprofessional commercialism in other advertisements. This JOURNAL, as well as the Journal of the American Medical Association, carries the advertisement of a publishing house advertising a work as being written by 'the world's most emment authorities' I have carefully scrutinized this list of authors, and while many of them are eminent men the list is not made up by means of 'the world's most emment authorities,' and the statement is false

"I am strongly of the opinion that a medical journal properly to represent the medical profession should carry no advertisements However devoutly this consummation is to be wished for, it is doubtful if it will find general approval The Medical Society of the State of New York could afford to publish a journal without advertisements if it desired to

doubt if it would care to do it"

Medicine has undergone an evolution during the twenty years since Dr Warbasse was editor, and one of the most striking developments has been the recognition of the leadership of physicians in all lines of medical service through the County Medical Societies The result is that the records of meetings of county medical societies are much more than mere "catalogues of the activities of local medical societies," but they are records of the practice of medicine by those societies

The story of the growth of the discharge of civic duties by physicians has been one of sensitizations and desensititions by both the medical profession on the one hand and voluntary organizations on the other, with the State Department of Health preserving some degree of neutrality There have been challenging chips on the shoulders of physicians, and volumes of propaganda put out by the lay health organizations, and out of it all has come the Committee on Public Relations of the Medical Society of the State of New The great work of this Committee is to sensitize County Societies to their assumption of leadership in all activities relating to the practice The State has been divided into of medicine districts which has been assigned to the five members of the State Committee, as described on page

1432 of the December first JOURNAL The plan of the Committee is to induce each county society to make a survey of the health activities in its county and to get in touch with the leaders in every line of health work. Nor does it apply to drugs There is just as much unprofessional commercialism in other advertisements. This JOURNAL, as well as the Journal of the American Medical Association, carries the advertisement of a publishing house advertising a work as being written by 'the world's most eminent authorities' I have carefully scrutinized this list of authors, and while many of them are eminent men the list is not made up by means of 'the world's most eminent authorities,' and the statement is false

"I am strongly of the opinion that a medical journal properly to represent the medical profession should carry no advertisements. However devoutly this consummation is to be wished for, it is doubtful if it will find general approval. The Medical Society of the State of New York could afford to publish a journal without advertisements if it desired to I

doubt if it would care to do it"

Medicine has undergone an evolution during the twenty years since Dr Warbasse was editor, and one of the most striking developments has been the recognition of the leadership of physicians in all lines of medical service through the County Medical Societies. The result is that the records of meetings of county medical societies are much more than mere "catalogues of the activities of local medical societies," but they are records of the practice of medicine by those societies

MEDICAL PROGRESS

Differentiation of Cardiac Pain - J S Lankford emphasizes the importance of distinguishing the different types of pain associated with the various forms of heart disease, as the treatment may differ considerably With the agonizing pain of true angina pectoris the patient stops rigid, breathless, pale, with features revealing the imminence of death The pain is usually under the sternum, in the left shoulder and the inner part of the left arm and wrist, sometimes the right side is affected in the same way. He cites one case in which there was great pain in the wrists in front of the joint only, and the patient had been treated for rheumatism Atheroma of the large arteries with lime plaques in the aorta or about the aortic region of the heart causes suffering quite similar to that of angina pectoris, but the pain is less spasmodic and likely to be frequently repeated or almost constant under exertion or excitement Aortitis causes very severe pain under the upper portion of the sternum on exertion, with great tenderness in the second interspace on the right of the sternum and there is heavy pulsation of the carotids In these cases digitalis is not useful unless there is extensive hypertrophy of the left ventricle with decompensation. Suprarenal extract helps some patients Aneurysm causes pain and soreness according to the direction of the pressure Cholecystitis or other gall-bladder disease not infrequently gives rise to substernal pain that closely simulates some cardiac symp-A condition that may be confused with aortic disease on account of the substernal pain is mediastinal lymphadenitis. In chronic myocarditis before grave impairment has taken place, effort may produce pain under the sternim, usually well localized Hypertension, especially when the kidneys are involved, causes substernal pain and hyperalgesia about the chest. When the heart and kidneys become gravely impaired and toxemia is extreme, there is severe pain in the gastric region, which yields poorly to medication Widely scattered anginoid pains occur in hypertension with autointoxication. The neurocirculatory heart leads to hypersensitive areas in the fifth interspace below the nipple, in the fourth at the sternum, and in the third above the nipple This condition is relieved by exercise and nervines, and diathermy and alpine light are valu-Indigestion with gas pressure upon the heart will cause apical pains of stabbing character, which are rarely of much gravity A heart not up to standard may suffer from fatigue pain like that of any other muscle -American Medicine, October, 1928, xxxiv, 10

The Geographical and Climatic Distribution of Rheumatic Fever —T Tertius Clarke, writing in the Medical Journal and Record. November 7, 1928, exxviii, 9, propounds a new theory of the cause of rheumatic fever Statistics and the experience of medical men in the tropics show that neither rheumatic fever, nor chorea, nor mitral In the United stenosis occurs in the tropics States and Canada there is a remarkable parallelism between the distribution of rheumatic fever and that of Ceratophyllus fasciatus, the common This insect can exist only if the temperature is low and humidity high. A temperature of 70° F seems to be incompatible with its continued existence Rheumatic fever is proportionately about twenty times more common among the children of the working classes than it is among the children of the rich It is obvious that the rat would be found in badly built houses, in those lying low and near water courses, and it would usually have access to houses where dampness is found. The environmental conditions of rheumatic fever are the same as those of the rat The reason for the absence of the disease from the tropics can hardly be due to the absence of a bacillus, for in the tropics the cultures of bacilli do not require an incubator Clarke, therefore, submits that the rat's temperate climate flea, Ceratophyllus fasciatus, is the unknown factor which would supply the key to the etiology of rheumatic fever, and suggests that this hypothesis is worthy of investigation

Rheumatic Sore Throat (Peritonsillitis) -Prof S Graff says that the association of angina with typical joint rheumatism is well known, but even clinicians, while admitting the association, do not regard it as one of cause and effect They claim that there is nothing to prevent the secondary implication of the tonsil after a general in-Conditions in a way are parallel with those of tuberculosis or other chronic infectious The author, as a result of his observations, concludes that this lesion is essentially a peritonsillitis but that there is no evidence to determine whether it is a primary or secondary manifestation The material studied was purely autopsy and no examination of extirpated tonsils is mentioned in this connection In general the subjects had succumbed to heart disease of rheumatic origin The author emphasizes the value of the discovery of Aschoff's nodes as an index of a rheumatic process Histologically these represent a specific process and they have even been found in the heart muscle itself. They show beyond doubt that rheumatism is essentially an infectious disease, the specific exciter of which is

still unknown, although it is admitted that the blood is first infected and the tissues in general later. The causal organism shows a distinct tendency to attack loose connective tissue. There seems to be a special predilection for the joints and the heart, but this is only an assumption based on clinical appearances, for there are reasons for the belief that all of the connective tissues of the body are equally involved —Deutsche mediziuische Wochenschrift, Oct. 19, 1928

Acute Laryngeal Stenosis and the Weather -Dr de Rudder says that he has long studied a certain relationship between the weather and the occurrence of acute laryngeal stenosis, the latter quite independently of the basic disease upon which the stenosis developed Clinically the children have croup, of course, the basic disease being any acute infection of the larynx, whether diphtheria, influenza, or measles A tabulation of 49 cases shows that only these three diseases were represented Numerically these cases are infrequent and the author's 49 cases were seen over a period of three years. There is a tendency for such cases to occur in cumulative incidence at certain times and localities with long periods of absence. Strange to relate the season of the year and the basic disease play no rôle, but the author believes that he has traced a notable connection with the meteorological conditions which he sums up under the name of "stenosis weather" surface characters of the weather, as cold, warm, rainy, etc., do not figure, but real factors are the moisture of the air, the direction of the wind, the sudden change of temperature, and all other meteorological elements which go to make up weather in the scientific sense Ideal meteorological conditions are winds blowing suddenly from low pressure areas with intervals of inter-Naturally there is an individual susceptibility to croup, but it does not figure in the present problem A study of the author's table shows that the stenosis was severe in type and that intubation or tracheotomy was required in some of the measles and grippe patients as well as in the diphtheria cases. Whether or not edema of the glottis was present is not stated False croup seems to be definitely left out of consideration and the author says nothing as to whether his ideal stenosis weather exerts any influence on laryngismus Cases are mentioned as complicating scarlet fever although these are not included in the author's table.—Klimsche Wochenschrift, October 28, 1928

Diabetes and Heredity—In his records of over 800 cases of diabetes mellitus P J Cammidge found that 224 (28 per cent) gave an ancestral or family history of the disease. With the object of throwing fresh light on the part played by the hereditary factor, he carried out breeding

parents have an abnormality of carbohydrate metabolism giving rise to a high fasting blood sugar. all the offspring will be similarly affected. If one parent is affected and the other not, all the offspring will appear to be healthy, but all will be hybrid carriers and transmit the disability to their descendants If one parent is affected and the other is a hybrid carrier, half of the offspring, on an average, will be affected and half will be hybrid carriers When two hybrid carriers mate, one-fourth of the offspring, on the average, will be affected and three-fourths will be apparently normal, though two out of three will be hybrid carriers Owing to single births, limited families and the monogamous habits of the human species, clear-cut evidence of heredity comparable in every respect to the experimental breeding of animals cannot be expected, but it is evident that they are governed by the same principles. This is shown by remarkable family histories which demonstrate that defects of carbohydrate metabolism may be transmitted as either a recessive or a dominant character At present it is not clear whether the inherited factor is itself the cause of diabetes or merely predisposes to the development of the disease, nor has it been determined that an hereditary factor is a necessary basis for its development in The main value of the evidence is in indicating that the marriage of diabetics is inadvisable and intermarriage between families in which there is even a remote history of the disease is to be discouraged The children and grandchildren of such unions should be watched and guarded from exciting causes likely to develop a latent or hereditary defect -British Medical Journal, October 27, 1928, 11, 3538

Iodized Salt for the Whole of Switzerland -O Stiner states that thus far six of the Swiss Cantons have introduced the general use of 10dized salt, and ordinary salt can be had only by special request. The Canton Wallis which first tried the experiment will not make the medicated salt compulsory and in all of the others the use of the same varies greatly. The results where it is used have not been brilliant and there is always the fear of public indifference and relapse to former conditions The Swiss Goitre Commission nevertheless recommends the use of the salt for the entire country Members of the medical profession are told that, however they feel individually on this subject, they should regard the movement as an experiment to rid the country of a great blemish and should support it loyally Commission voted unanimously to extend the prophylaxis to the entire country. The standard amount of iodine to add to the salt is half a gram of potassium iodide to 100 kilos of salt. recommendation by the Commission evidently puts all responsibility up to the Government, with the necessary enforcement provisions It should not be difficult to control the public supply of salt and to medicate it The execution of the enforcement provisions is apparently to be left to the Cantonal authorities—Schweizerische medizinische Wochenschrift, Oct 13, 1928

Ketone Diet in Epilepsy—After two years' experience with the ketone diet in epilepsy, W W Harper concludes that a large number of epileptics will be benefited by this diet (Southern Medical Journal, November, 1928, xxi, 11) Favorable results, however, will only be obtained when the diet is rigidly adhered to and when the urine shows a strong acetone reaction. Most of the failures will be found to be due to a break in the dietary régime. It is extremely difficult to make children take the excessively high fat diet The formula for the diet provides carbohydrates, protein, and fat, in the proportion of 30 of the first, 30 to 40 of the second, and 100 of the third A menu providing these proportions is given this diet fails to induce acidosis, the fat should be increased by giving more butter or French dressing on the salad If weakness or exhaustion occurs it means that there is too little sugar in the blood, and relief will be afforded by a lump The ketone diet is unof sugar or an orange suited in cases in which attacks occur at weekly or monthly intervals Patients not improving under a strict ketone diet often show an immediate improvement when luminal is added to the diet And, again, those influenced by luminal begin to improve when the ketone diet is added

The Allergic Factor in Mucous Colitis — Warren T Vaughan reports seven cases of intractable mucous colitis in which the patients reacted positively to several proteins, and when these were eliminated from the diet improvement He calls attention to certain points of similarity between bronchial asthma and mucous colitis, particularly that in both diseases the two outstanding features are smooth muscle spasm and increased secretion of mucus In both conditions headache of a migrainous type is rather common and other allergic manifestations are not infrequent The parasympathetic innervation of the last half of the colon is of the same type as in the bronchial tree and is more direct than is the innervation of the upper intestine Lyon and Bartle, in describing the victim of mucomembranous colitis state that there may be a history of eczema urticaria, asthma, angioneurotic edema and erythema multiforme, but they fail to take this analogy to allergic conditions into consideration when they discuss the treatment. In experimental anaphylaxis there is strong evidence that the intestinal tract may react as well as the bronchial A further analogy between bronchial asthma and mucous colitis is found in the claim that cases of hyperesthetic rhinitis and of bronchial asthma, when associated with diminished blood calcium, respond very satisfactorily to ultraviolet

light, and cases of mucous colits with low blood calcium have been observed to respond equally well to actinotherapy. In most of the author's cases treated on the assumption that food allergy was a factor in the causation of the mucous colitis, complete relief was not obtained. He therefore concludes that some of the numerous other etiological factors were active at the same time, but this does not invalidate the theory, since in bronchial asthma and hay-fever many factors often play a part—Southern Medical Journal, November, 1928, xxi, 11

Is There An Intestinal Grippe?—Dr J K Friedjung of Vienna, asks and then answers this question in the affirmative. In the recent local epidemic, a patient attacked in the ordinary manner with the disease developed constant desire for stool followed somewhat later by profuse diarrhea A fellow practitioner suffered in a like manner, as did the author himself Nevertheless the author was not entirely satisfied with the diagnosis as "intestinal grippe," for some of the leading internists look on such a diagnosis as a mere makeshift He, therefore, read up, especially in American and British literature, and found abundant evidence of such a clinical entity. He chose chiefly the literature of the past five years although one can find the condition mentioned by old In his study of recent literature he finds a choleriform condition often present in infants and young children as a complication The mortality is high and conof influenza fusion with appendicitis common, as well as with ileus In some children the picture is one of hyperemesis, in others of dysentery There can be no doubt as to the existence of a gastroenteric grippe To return to this condition as manifested in adults, the author cites cases seen by him after his attention had been directed to the syndrome One of his house servants was attacked with abdominal pain and diarrhea which proved refractory to laudanum although relieved by charcoal absence of other phenomena and of ordinary exciting causes, he seems to have made a diagnosis of intestinal grippe. In closing he calls attention again to the multiform character of the symptoms in children—a gastroenteric form, a purely enteric form without gastric symptoms, a dry form simulating appendicitis, a colonic type, and a dysenteriform type Fever is always present and there is sufficient collateral evidence to connect the cases with ınfluenza — Deutsche medizimsche schrift, September 28, 1928

Treatment of Climacteric Troubles—F Ertl and Carl Mayer regard the term "climacteric troubles" as elastic and often used to cover diagnostic inability. The atrophy of the ovaries upsets the endocrine equilibrium, so that the picture

may vary greatly and may be dependent on group factors Thus the robust woman of the pyknic habitus is said to suffer very little, and to seem to be relatively immune at other developmental pemods—puberty, menstruation, and gestation The asthenic type which also corresponds to the ptotic may suffer from mild or severe syndromes latter often point to derangement of the vegetative nervous system, usually a heightened sympathicotonus, combined with circulatory and mild affective mental disturbances, sometimes explained by mild hyperthyroidism. The treatment of these menopausal symptoms has embraced nearly everything on the merely empirical side, but recently there have been numerous attempts at a scientific management, beginning naturally with ovarian feeding, to be combined later with other rational substances like calcium to antagonize nervous irritability, and with frankly symptomatic remedies Some of the formulæ proposed and tested suggest the ancient "shotgun" or polypharmaceutic prescriptions of a past age of these formulæ comprises the ovarian hormone in combination with lipoids, a purgative for the almost constant obstipation, a cardiac sedative, and remedies believed to dilate the bloodvessels and lower the blood pressure One formula intended to be given for months at a time contains -naturally in minute doses-such drugs as nitroglycerin and amidopyrine, or the double salicylate of sodium and caffeine Relief is at best incomplete and inconstant -Münchener medizinische Wochenschrift, October 12, 1928

The Action of Saliva and Gastric Juice on the Clotting of Blood-The rapidity with which wounds in the buccal cavity stop bleeding and the firm clot that occurs in that situation, and also the common observation of the licking of wounds by animals, led John B Hunter to test the effect of saliva on the coagulation time of The experiments which he carried out indicate that the coagulation time of the blood is definitely reduced by the addition of saliva was found that centrifuged saliva acted better than plain saliva and that the passage through a Berkefeld filter did not alter the action experiments showed that the coagulation time was markedly delayed by gastric juice, and that this delayed period was shortened by the presence of If the hydrochloric acid in the gastric Juice was neutralized by sodium bicarbonate the clotting time was lengthened. The delay in clotting time was marked in the presence of highly acid juices such as occur in gastric and duodenal The clot formed in the presence of free hydrochloric acid was jelly-like and never firm From these observations it may be deduced that the substance which hastens the clotting of blood is either destroyed or precipitated by weak acids

Hunter suggests that this substance is identical with tissue fibrinogen Hematemesis of a severe variety is chiefly associated with simple gastric and duodenal ulcers, that is, with conditions where the acidity of the gastric juice is high The addition of more tissue fibringen to the stomach under such conditions should materially aid clotting, and this is supplied by saliva. The indications in hematemesis from simple gastric and duodenal ulcers would seem to be (1) to augment the flow of saliva by the sucking or chewing of some innocuous substance, (2) to neutralize the gastric juice by frequent small doses of alkali, and (3) to restrict the movement of the stomach by rest and the administration of morphine—British Journal of Surgery, October, 1928, xvi 62

Prungo, Pruntus, and Lichenification -H Haldın Davıs endeavors to give a clear conception of what is meant by the terms of the title. After describing prurigo ferox and prurigo mitis, he discusses prurigo Besnier and prurigo nodularis. which have no relation to true prurigo and are now said to be allergic conditions Idiopathic pruritus is essentially a neurotic symptom true test of its presence is interference with sleep Localized pruritus may affect any region of the body, when it occurs in the neighborhood of the perineum (pruritus ani, pruritus vulvae, and pruritus scroti) it is elevated to the rank of a definite disease. As a rule the affected area is the seat of changes which are termed lichenification. the exact nature of which is obscure, but it may best be regarded as the end stage resulting from a number of forms of subacute inflammation When pruritus is so situated that an occlusive dressing can be applied, Unna's paste is the most convenient. In the case of pruritus ani, vulvae or napex (where the scalp ends at the neck), where it is impracticable to apply a dressing, the X-rays, radium, or ultraviolet light may be useful X-rays always relieve the condition, whether associated with lichenification or not A half-pastille dose is given three times with an interval of two weeks between treatments, then after four weeks a final half-pastille dose is administered times a recurrence can be cured by radium, even though the X-rays have failed Ultraviolet light Davis has found disappointing, as it gave only temporary relief In all cases of lichenification, irradiation must be followed by the use of some oily substance, such as vaseline or lanolin irritation is often relieved by some phenol derivative, preferably liquor picis carbonis, which may be incorporated in an ointment or painted on undiluted, and followed by the application of vaseline or lanolin Davis is opposed to the surgical treatment of pruritus for the reason that he has not seen any case in which it has proved successful — The Practitioner, November, 1928. cxxx1, 5

LEGAL

By LLOYD PAUL STRYKER, ESQ Counsel, Medical Society of the State of New York

IS LAW A SCIENCE?

Science has been defined as "knowledge gained by a systematic observation, experiment and reasoning, knowledge coordinated, arranged and systematized, also the prosecution of truth as thus known, both in the abstract and as a historical development" Three essential elements, therefore, are noticeable in this definition, (a) observation, (b) experiment, and (c) reasoning, and all of these must be "systematic" These three acts, when "coordinated, arranged and systematized," result in that knowledge which is defined as "science" All of the accumulated wisdom in regard to the care, treatment and function of the human body is the result of "observation, experiment and reasoning" This knowledge arranged and systematized has been placed at the disposal of medical students through the lectures and treatises of experts, and the knowledge thus acquired is finally placed at the disposal of the human race through the medium of the medical profession.

The very essence of science denotes the idea Science is not merely the result of progress of past observation, experiment and reasoning, but is based upon a continued exercise of these A scientist is one trained in observation, experiment and reasoning His observation will be of little value, unless he is capable of making logical and sound deductions from it, nor will this be of worth unless it is constantly corrected by experiment Because of the fact that all that it is possible to know about the human body it not yet known, medicine is peculiarly a progressive science New truths are being constantly discovered, and when demonstrated, are accepted There is nothing absolute in medicine For this reason medicine is often spoken of as an inexact science

The subject of this, the seventh in our series of editorials, has to do with the question, "Is law a science?" Law, like medicine, is in a state of flux. The rules of conduct which were accepted as binding by one generation, are repealed by the legislatures of a succeeding one, or are altered or qualified by new decisions in the courts. The sources of law are the opinions of the judges, the statutes and the works of the great textwriters. It is there that the principles of law are found, but the application of those principles to a given state of facts requires the reasoning faculty. A reliable application of those principles can be made only by those experienced in the observation and study of those principles.

and in reasoning upon them. How difficult this is, is suggested by the old adage that there never were two cases exactly alike. The lawyer, therefore, like the physician, has no arbitrary rule of thumb by which to guide his course. He must ascertain what the principles are, but when this is done, his work has only started, for he must make a correct application of those principles to the facts in hand. To understand the principles, he must understand the reasoning upon which they are based. He must not only know the rule of law, but he must understand the reasoning upon which it is founded.

But law, like medicine, is constantly in a state of change. The recognized principles of conduct which make up the content of our law, express the views of right and duty of the particular generation by which those principles were accepted. These concepts change with changing generations. In the nineteenth century, there was as great an alteration in the principles of law as in that of every other science.

"Every one instinctively recognizes," Oliver Wendell Holmes has written, "that in these days the justification of a law for us cannot be found in the fact that our fathers always have followed It must be found in some help which the law brings toward reaching a social end which the governing power of a community has made up its mind that it wants And when a lawyer sees a rule of law in force, he is very apt to invent, if he does not find, some ground of policy But in fact some rules are mere for its base survivals Many might as well be different, and history is the means by which we measure the power which the past has had to govern the present in spite of ourselves, so to speak by imposing traditions which no longer meet their original end History sets us free and enables us to make up our minds dispassionately whether the survival which we are enforcing answers any new purpose when it has ceased to answer the practical study of the law The true science of ought also to be scientific the law does not consist mainly in a theological working out of dogma or a logical development as in mathematics or only in a study of it as an anthropological document from the outside, an even more important part consists in the establishment of its postulates from within upon accurately measured social desires instead of tradi-

And Mr Justice Holmes further wrote "Well,

in the law we only occasionally can reach an absolutely final and quantitative determination, because the worth of the competing social ends which respectively solicit a judgment for the plaintiff or the defendant cannot be reduced to number and accurately fixed The worth, that is, the intensity of the competing desires, varies with the varying ideals of the time, and, if the desires were constant, we could not get beyond a relative decision that one was greater and one But it is of the essence of improvement that we should be as accurate as we can * * * When we say that a workman takes a certain risk as incident to his employment, we mean that on some general grounds of policy blindly felt or articulately present to our mind, we read into his contract a term of which he never thought, and the real question in every case is, What are the grounds and how far do they extend? The question put in that form becomes at once and plainly a question for scientific determination, that is, for quantitative comparison by means of whatever measure we command When we speak of taking the risk apart from contract, I believe that we merely are expressing what the law means by negligence, when for some reason or other we wish to express it in a conciliatory form 2 times tell students that the law schools pursue an inspirational combined with a logical method, that is, the postulates are taken for granted upon authority without inquiry into their worth, and then logic is used as the only tool to develop the results It is a necessary method for the purpose of teaching dogma But masmuch as the real justification of a rule of law, if there be one, is that it helps to bring about a social end which we desire, it is no less necessary that those who make and develop the law should have those ends articulately in their minds I think it most important to remember whenever a doubtful case arises, with certain analogies on one side and other analogies on the other, that what really is before us is a conflict between two social desires, each of which seeks to extend its dominion over the case, and which cannot both have their Where there is doubt, the simple tool of logic does not suffice, and even if it is disguised and unconscious the judges are called on to exercise the sovereign prerogative of choice "3

Nothing could be more remarkable than the change of legal concepts during the past century. In the year 1800 in England, more than two hundred crimes were made punishable by death. Thus, the stealing of property valued at five shillings, or the stealing of anything above the value of one shilling from the person of another, was punishable by hanging. If a soldier or sailor in those days wandered about the country begging without a pass, he was hanged A person convicted of treason in those days was drawn on a hurdle to the place of execution, was hung

my the neck and then cut down while alive, his bowels were then taken out and burned before his face, his head was then severed, and his body cut into four quarters and placed over the gates of cities to poison the air. It was not until 1870 that the statute changed all this 5

The rules of civil procedure in those days were almost unbelieveably unworkable and complex Down to 1802, there were three superior courts of common law, and there was the court of equity, all held in the great hall of William Rufus These tribunals met within a few feet of each other on the same floor, and were not separated from each other by partitions. Yet, if a litigant mistook the form of action, his case was thrown out of the particular court in which it was brought, and he was forced to start all over All of the various technical forms of action were finally abolished, but it was not until about 1846 that the movement was begun both in England and in this country which led to a simplification of the rules of procedure, whereby a litigant stood some chance of having his case heard upon the merits without being shunted about from court to court, unable to find out in which tribunal he should have started

But nothing is more notable in the history of law than the changed attitude of courts and legislatures toward labor questions. In the reign of Edward III, under "The Statute of Laborers" every man and woman under the age of seventy who was not exercising any craft and who possessed no land and who was not already employed, was bound to work for anyone who required his services "at the wages heretofore accustomed to be given"8 If he refused, he was sent to jail This statute was not repealed in England until 1863 Down to the year 1871, labor unions were illegal in that country, and their members were often prosecuted for and convicted of conspiracy As late as 1875, it was still a criminal offense for a workman to break his contract of employment 7 The change in legal concepts, both legislative and judicial, in regard to labor and labor unions is too well known to require comment

This subject could be expanded almost without limit. Its discussion would require a review of the law of married women. It was not until 1886 in England, that a widow was made the guardian of her children. In 1840, the English courts held that the husband held control over the person of his wife, as well as the ownership of her personal property, and if he saw fit to put her under lock and key, she could not gain her release through habeas corpus. It was not until 1890 that a husband's right to chastise his wife under any circumstances was first denied in England.

In an interesting paper read by Judge Frederick E Crain of our Court of Appeals and delivered over the radio under the auspices of the Bar

1484 LEGAL

Association, he declared "In fact, the law is but a reflection of the morals of the time. Those who make and administer the laws are just like other people, and seldom rise above them Men cannot in making and enforcing the laws go in advance of their time As evidence of this we recall the trials for witchcraft These took place over Europe and in this country less than three hundred years ago We can hardly imagine today learned, careful, painstaking men seriously trying women for witchcraft and believing that they had entered into compacts with the devil whereby they could cast over others evil spells, cause death and travel on broomsticks through the air "o

Judge Crain then referred to the age of Queen Elizabeth as one of the most enlightened eras in the history of England, the time of Shakespeare, but he says "What about the administration of law in this enlightened age? In November of 1603 Sir Walter Raleigh, for treason in Winchester, in England, before a commission made up of some of the leading nobles and justices of that country No witnesses were called against him Statements made out of court by one Lord Cobham were read Raleigh in vain asked that Cobham might be brought to face him, as he had retracted all these Such was not the practice of the time, and the request was refused Raleigh was convicted and later executed Under the loose procedure of the day, which was common and in accordance with the times, the person need not be confronted with the witnesses who had testified against him Their testimony could be given and taken in secret, charges of crime were never precise, and if made at all, were read to the prisoner at the time-or just before his No counsel were allowed the accused in many cases, and he could not be a witness for himself"

It was because of this and other state trials in England that the sixth article of our bill of rights was added to the American Constitution "In all criminal prosecutions, the This provides accused shall enjoy the right to a speedy and to be informed of the nature public trial, and cause of the accusation, to be confronted with the witnesses against him, to have compulsory process for obtaining witnesses in his favor, and to have the assistance of counsel for his defence"

Tracing the growth of our principles of justice,

Judge Crain continues "Our law is not a system of rules devised and brought to pass out of the minds of learned men, or any class of men, neither are they rules forced upon us by some overlording power, but rather our laws have come to us through the action of the people themselves, adopted out of bitter experiences of the past, and are the result of a gradual growth in wisdom and knowledge of men, of affairs, of the purpose and objects of government. They have kept pace with the moral and intellectual development of the people at large As the people have advanced in civilization, so

likewise has it advanced their conception of law and of justice, until today we have a refined, complicated system which reaches out into every activity of life, regulating and controlling man in his conduct toward his family, his neighbor, the nation and other nations. While for practical reasons, the law has not risen, and probably never will rise, to the heights of morality or to that justice which religion inculcates and teaches, yet there never was a time when the law, as carried out by our courts today so nearly approached this high standard More and more does the law of our land come near to the morals of the people 'The common law of England is not a compendium of mechanical rules written in fixed and indelible characters, but a living organism which has grown and moved in response to the larger and fuller development of the nation'"

The law, then, may be truly said to have been built upon the knowledge gained by systematic observation, experiment and reasoning Through the work of our legislatures and our courts, this knowledge has been arranged and systematized, and that process still continues Law, then, may be truly designated as a science no science more vitally affects the citizen in his daily life, or is more important to those three prerequisites to a tolerable existence life, liberty and the pursuit of happiness

LONDON LETTER

MEDICAL SCHOOLS, HOSPITALS, MEDICAL WORK

Opening of the Medical Schools-With the opening of the Winter Session of the Medical Schools attached to the Hospitals there has been the usual number of addresses given to the newly enrolled students It seems difficult to think of anything fresh to say on these occasions, and one generally finds that the orator urges his audience of neophytes to be diligent in their studies and to grasp every opportunity of acquiring knowledge Dr Watts Eden at Charing Cross Hospital hit upon the happy idea of pointing out the fluctuating value of the knowledge of the moment "The knowledge held to-day might in ten years' time prove to be wrong, possibly so far wrong as to be dangerous in its application, and for the practitioner of medicine the sense of being at school continues throughout the whole of his career" True as this statement is, one cannot help feeling that even the most eager student might have his enthusiasm clouded by the shadow of perpetual schooling, and would have thought it more merciful to allow the realization of lifelong servitude to an exacting mistress to soak in by degrees After all, we know it soon enough. Another line altogether was chosen by Professor Ernest Barher at King's College Hospital, he spoke of the less troublous period of Hippocrates and Aristotle, and with his profound knowledge of political science gave a fascinating address culminating in the advice that the student should learn to clothe his physic with some philosophy and some general wisdom, taking for an example his old friend, Sir William Osler A better choice could hardly have been made, for Osler, trained as he was in Canadian and American Universities, consolidated his fame by his labors in England to raise medicine to the highest pinnacle of the liberal sciences

Road Accidents and the Hospitals—The amazing development of road motor traffic of recent years has led inevitably to a corresponding increase in accidents to members of the motoring fraternity and to pedestrians. This has led to a very acute hospital problem affecting not London alone, but perhaps particularly the "Cottage Hospitals" in country villages and smaller towns. These Cottage Hospitals, erected for the reception of the sick in the immediate neighborhood, and generally confining their activities to the more minor ailments (for serious cases and those needing major operations can be better dealt with in the larger institutions) find themselves confronted with a steady stream of accident cases, some of

them of great severity, among motorists from all parts of the country who have no claim upon them whatever except that of sudden and dire Some of these hospitals, indeed, find emergency that the demand made upon their beds by accident cases is so large that the relief of their own people is seriously jeopardized and great need is experienced for additional accommodation. For the building and equipment of these additional beds and for their maintenance money is required, and this money is not forthcoming. It might be thought that some of the increased expenditure could be obtained from those receiving benefit and especially that, as in these days nearly all motorists insure against third party risks, the expenses incurred by the hospitals in the treatment of these insured parties should be made good by the insurance companies This is, however, far from being the case, partly owing to the constitution of the voluntary hospitals, which lays down that they shall admit as far as possible all cases of accident and emergency, and partly because the medical staffs give their services and cannot therefore make a claim for payment for professional treatment. The hospitals cannot, it seems, make any claim which would be considered in the law courts, and naturally enough the insurance companies do not recognize an obligation which cannot be enforced by law as the large London hospitals are concerned, there is no doubt that the increase in accident cases has made great demands upon their beds and has thus lengthened the already too long waiting lists, but the pressure is relieved to some extent by the Poor Law Hospitals, to which many of these accident cases are taken

The Strain of Medical Work—The recent suicide of two medical men has directed public attention to the strain to which doctors with busy practices are subjected. One correspondent ventures to suggest that the emotional pressure on a doctor must be as great as that upon a leading actor! Those of us who know what the pursuit of medicine demands of its votaries will smile rather grimly at the parallel The very idea of comparing the hopes and fears of an actor, anxious to gain the sympathy and applause of his public, with the responsibility of the doctor's life and death struggle for his patient, shows that with whatever gifts kindly nature has endowed our correspondent, a sense of proportion is not H W CARSON, FRCS among them

NEWS NOTES

EXECUTIVE COMMITTEE

A meeting of the Executive Committee of the Council was held at the State Society rooms, 2 East 103rd Street, on Thursday, November 8, 1928

Under the Reports of Committees, Dr Farmer, Chairman of the Committee on Public Health and Medical Education, reported that he had completed an analysis of the various lectures given under the Committee during 1927, and that a similar analysis was being prepared for this The most outstanding activities of the Committee for the past month were the two weeks courses of five lectures in Medicine and five in Surgery given in Rochester before the Counties of Monroe and Livingston and in Batavia before the Counties of Genesee, Orleans and Wyoming The attendance in both places had been most satisfactory, in fact, a non-member of the Society who had attended these lectures at once sent in his application for member-A course in Gastro-Enterology has been started in Cayuga County, and other courses are in preparation for Ontario, Sullivan, Steuben and Delaware, the attendance at previous lectures of the last county being over 80% Dr Farmer also stated that the work was being greatly facilitated by the cooperation on the part of the nearby counties to select the same subject

Dr Vander Veer, Chairman of the Special Committee to Consider the Annual Meeting and Make Recommendations Thereto, reported the following recommendations adopted by this Committee That the Annual Meeting be held in Utica, that the Chairman of the Committee on Arrangements be a resident of Utica, that the arrangements and handling of the commercial exhibits be in charge of the Advertising Manager under the supervision of the Editor-in-Chief, that the general registration and publicity be in charge of the Executive Officer, that a special

Committee be appointed by the Executive Committee to have charge of the general arrangements of the Annual Meeting The President appointed Drs James N Vander Veer, John A Card and Orrin S Wightman as this Committee

It was voted that the next Annual Meeting be held in Utica, June 3rd, 4th, 5th, and 6th, 1929
Dr Hyzer W Jones of Utica was appointed

Dr Hyzer W Jones of Utica was appointed Chairman of the Committee on Arrangements

The Report of the Committee on Scientific Work and the Report of the Committee on Publication regarding the syndicating of articles on indical subjects for the leading newspapers were referred to the Council

The Executive Officer gave a resume of the Annual Meetings of the District Branches which showed an increasing interest and marked increase in attendance over the meetings of the past few years

In reply to a letter received from one of the County Societies asking for an opinion as to the line of demarcation between medical advertising and medical publicity, the following resolutions were passed

"That it is the opinion of the Executive Committee of the Medical Society of the State of New York that medical publicity is educational and deals with the medical profession in its entirety—whereas medical advertising appertains to the medical publicity which deals with the individual only and may be used to his or her personal advantage"

The Executive Committee endorsed the idea that the Counsel write a book on Physicians' Rights and Duties

It was decided to hold the next meeting of the Council in the State Society rooms, New York City, Thursday, December 13th

D S Dougherty, Secretary'

THE SECOND DISTRICT BRANCH

The annual meeting of the Second District Branch was held on the evening of December 6, in the Chamber of Commerce Building, 60 Court Street, Brooklyn, with about 60 members present The President of the Branch, Dr Guy H Turrell, of Smithtown Branch, presided The meeting began at 7 o'clock with a dinner, which was followed by a business session at which the following officers were elected

President, Charles H Goodrich, Brooklyn, First Vice President, L. A Van Kleeck, Manhasset, Second Vice President, T C Chalmers, Richmond Hill, Secretary & Treasurer, Alec N Thomson, Brooklyn

These officers were suggested by a nominating committee which was appointed for the purpose canvassing the membership in order to secure those physicians who are both active and ex-

nemenced in medical society affairs, for the President of the Branch is an important officer in the Medical Society of the State of New York

The program of the scientific session was carried out with unusual snap and vigor. It was different from that of all the other District Branch meetings in that it was devoted entirely to subjects relating to the county medical societies First there were reports of the activities of each of the four county societies which compose the Second District Branch These reports were given as follows

Kings County, by Dr C H Goodrich Queens County, by Dr E A Flemming, Rich-

mond Hill

Nassau County, by Mr Louis Neff, lay Secretary, who read the report prepared by Dr A D Jaques

Suffolk County, by Dr W H Ross, Brentwood Brief remarks were made by the following officers of the Medical Society of the State of New York

Dr Harry R Trick, President, spoke of the post graduate work of the State Society, ably started by Dr C A Gordon of Brooklyn, and now managed by Dr T P Farmer, of Syracuse Dr J N Vander Veer, President Elect, spoke on the need that physicians should supply Dr Britt, Chairman of the Committee on Econimics, with data concerning unsatisfactory methods and decisions of the Workmen's Compensation Commission

Dr W H Ross, Secretary of the Public Relations Committee, told of the practical work of the Committee in inspiring county societies to assume the leadership in all forms of medical service

The principal address of the evening was given by Dr Louis I Harris who has just retired from over twenty years service in the New York City Department of Health, the last two or three being as Commissioner of Health, in order to accept a position as medical advisor of one of the largest dairy organizations

Dr Harris spoke plainly and unreservedly of the relation of physicians to public health work, He showed the ways in which the methods of volurtary health associations were defective, and outlined methods by which physicians can give essential service in public health and civic medicine

All the addresses were in concise form, and of a practical nature, and will be published in the next issue of this Journal

LECTURE BY THE EDITOR OF THE LONDON LANCET

The Kings County Medical Society held an open meeting on November 15, devoted to Medical Journalism, when Sir Squire Sprigge, Editor of the London Lancet, gave the principal address The meeting was preceded by a dinner given by Dr Charles H Goodrich to Dr Sprigge and some of the editors of medical journals

Sir Squire Sprigge graduated from Caius College, Cambridge, and St George Hospital, London, joined the Lancet staff in 1892, and was knighted in 1921 His twenty and more years of leadership have influenced medical journalism by lifting it to a higher cultural level He was present in this country in order to deliver the Hunterian Oration before the Clinical Congress of

the American College of Surgery

It was fitting that the introductory address should be made by a member of the Kings County Medical Society, who is Editor of the American Journal of Surgery, Dr Thurston Welton, who described in his breezy way impressions he gained through reading the first issues of the London Lancet Early nineteenth century reports of surg cal operations seem naive to us, for they make no reference to the way pain was borne or to the violent attempts to break free, and the operator is frankly described wearing a dirty apron with his assistant standing nearby with ligatures laced through his buttonholes in readiness how a tumor of the scalp was being removed

when the patient broke away and was "recaptured," only to escape and be caught three succes-The patient bled until she fainted, so the tumor "was removed painlessly" During a vaginal hysterectomy, the patient "lost no more than two pounds of blood"

Dr. Lewis Stephen Pilcher, also a member of the Kings County Medical Society, and distinguished as Editor of the Annals of Surgery, was confined to his home by illness and sent a brief word of greeting which was read by President Goodrich He said that the three purposes of a medical journal were, first to stimulate physicians and surgeons to advancing endeavors, second, to promote modern medical methods before the laity, and third to be an accurate record of local practice

Sir Squire Sprigge held his audience by his modest and intimate discourse, interpolated with subtle whimsies He narrated the story of the earliest medical records up through the ages The Babylonians described on a tablet 6000 years ago a case of dropsy that others might benefit thereby Then when the Æsculapian cult was in vogue, temples contained votive tablets recording the symptoms of the diseases, and what medicine effected the cure In those times therapy was essentially physiotherapy and massage, and sun treatment and hydrology were used effectively Hippocrates studied these tablets and began to

disregard the common superstitions about health and disease and recognized the need for rules of

living

Galen writing the Greek language in Rome 2000 years later for its cultural excellence, familiarized himself with Hippocrates and medical science, and added some schisms, which were not based on actual clinical records. Medicine suffered from his surmises and nothing progressive happened through the Middle Ages except the rise of Arabian learning. Haroun-al-Raschid founded the Academy of Bagdad during the 9th cen-

tury The large hospital kept commendable records Harvey was contemporary with printing, and his writings in Latin constitute the first medical periodical

The Lancet is a venerable periodical, but it was antedated by four other journals, which however dealt with all sciences. Dr. Sprigge's final message was a statement of the function of medical journalism which is to "Spread the message of medicine, which is crystallized in textbooks, and then challenged in the periodicals"

DEO

DIPHTHERIA PREVENTION

The November Board of Health Bulletin of the City of Middletown, Orange County, contains the following item which is an example of excellent medical publicity

"Diphtheria — Two active cases and one convalescent case of diphtheria were recently brought into Middletown from a dairy farm in the outlying district. That we have just escaped a mild epidemic is no concern of the family who brought their children here in order that the sale of milk from the farm would not be stopped. While these cases will not be counted against. Middletown's record—having been imported—that is not the important point to be considered. Our efforts are directed, not primarily towards a record, but towards preventing sickness and deaths

"The main points that do stand out prominently in this instance are—first, none of the cases ever had Toxin-Antitoxin, second, a bad case of nasal diphtheria of several days duration responded to diphtheria antitoxin, third, diphtheria has not been eradicated and will continue to be a menace to those children not protected with Toxin-Antitoxin

"These cases should bring forcibly to you the problem of future diphtheria in Middletown If your child is not protected, it may contract the disease and die With your present knowledge of diphtheria and its prevention, you cannot afford to take a chance Remember that riches and poverty look alike when diphtheria takes its youthful victims"

DR ETHAN A NEVIN

Dr Ethan A Nevin, Superintendent of the Newark State School, passed away on October 10, aged fifty years He was devoted to his chosen work of caring for the insane and feebleminded, and was a regular attendant at the meetings of his County Medical Society and District Branch He was also deeply interested in public health, civic and educational affairs of his village, and conducted a large Sunday school class for men

BIOGRAPHY OF GENERAL WOOD

The following letter may interest the personal friends of General Leonard Wood

"I am engaged on the authorized biography of General Leonard Wood, who, you will remember, started his career as a physician, entering the United States Army in 1885 as a contract surgeon. It has occurred to me that some of your readers might have had contacts

with General Wood and might be willing to tell me of them, or to send me any letters from the General, or any unusual photographs, which they may have"

Washington, D C

QUEENS COUNTY

A stated meeting of the Medical Society of the County of Queens was held at Eagle Palace, on October 30th, 1928, at 830 P M, with the president, Dr F G Riley, in the chair

The president made the following report

"At the meeting of the Comitia Minora held, October 13th, 1928, the matter of the study of the prevalence of Syphilis and Gonococcal infectations in Greater New York by means of a survey by the New York Tuberculosis and Health Association in which a questionaire would be submitted to each physician in the county requesting that they indicate the number of active cases under treatment on a given date, was considered

"After the Comitia Minors had convinced themselves that the data obtained would be confidential and controlled so as not to pass outside the knowledge of the member of the Medical Society to whom the data would be submitted, the Comitia Minors unanimously voted to recommend that the Society endorse and sponsor such survey"

After further explanation, it was moved by Dr H C Courten and seconded by Dr Harry Mencken that the Society approve of the survey if carried out as outlined in the report Passed unanimously

The president appointed Drs Buxbaum, Lawrence and Whelan, a Committee to retire and present a report of nominations of officers and boards for the year, 1929 In due time the Committee presented the following nomination

For President, William J Lavelle, M D, for Vice-President, Edward A Flemming, M D, for Secretary, E E Smith, M D, for Treasurer, James M Dobbins, M D, for Trustees, Francis G Riley, M D, James M Dobbins, M D, for Censors, Howard W Neail, M D, John L Both, M D, James R. Reuling, M D, for Historiam, Carl Boettinger, M D; Delegates to State Society, T C Chalmers, M D, H C Courten, M D, Wm J Lavelle, M D, Alternates to State Society, L Howard Moss, M D, James R. Rueling, M D, James M Dobbins, M D, Delegates to Second District Branch, L Howard Moss, M D, E A Flemming, M D, Wm J Lavelle, M D, Alternates to Second District Branch, Francis G Riley, M D, Carl Boettinger, M D

The nominations having been spread upon the blackboard, the opportunity for further nominations was afforded and no additional nominations were made

The Board of Censors reported as approved the following applications to active membership and they were unanimously elected Lazarus David Lobell, M.D., 3202 81st Street, Jackson H., William J. McCarthy, M.D., 104-17

118th Street, Queens, Martin L Quinn, M D, 4102 69th Street, Winfield, Thomas E O'Brien, M D, 163-09 Corcheron Avenue, Flushing, Milton H Schlesinger, M D, 101 North 108th Street, Corona

The following transfer was announced Charles L Quaintance, MD, 9419 Hollis Court Boulevard, Queens Village, from The Suffolk County Medical Society

The Treasurer called to the attention of the members the item on page ten of the October Bulletin relating to the enforcement of By-Law VI as to the procedure regarding members in arrears and made the appeal to the membership to pay their dues early in the year and avoid being deprived of the benefits of membership

Dr Mencken reported in regard to the progress of the work by the Committee on Graduate Medical Education

Dr Chalmers reported, for the Board of Trustees, total pledges for bonds for the new building, to the amount of \$215,800 00 Under the head of new business Dr Chalmers further offered and moved the adoption, seconded by Dr Flemming, of the following resolution which was unanimously adopted

"Whereas, the building fund of the Medical Society of the County of Queens amounts to \$215,000 and

"WHEREAS, the \$250,000 authorized will be raised in a very short time, and

"Whereas, when this \$250,000 is in the hands of the Trustees in signed subscriptions, the said Trustees will have to arrange with a bank or trust company to convert them into a Building Loan Mortgage with which to build the building,

"THEREFORE BE IT RESOLVED, that the Board of Trustees of the Medical Society of the County of Queens be and hereby are authorized to negotiate a first mortgage building loan when they have in their possession signed subscriptions to the amount of \$250,000"

The Treasurer's budget for 1929 was read by title and ordered to be published in the Bulletin

ESTIMATED BUDGET FOR 1929

Receipts

Dues from 425 members at \$20 00 \$8,500 00

New members estimate at \$40 00 2,000 00

DOCTORING BY BICYCLE

Times change, in Brooklyn as elsewhere The building of the Kings County Medical Society which was erected in 1898, was designed to pro-

vide space adequate for the Society "for all time" How up-to-date the plans were is indicated by

the storage space for bicycles in the basement, as is shown in the accompanying section of the architects drawing which is reproduced from the October Bulletin of the Medical Society of the County of Kings

When the visiting doctor next walks up the front steps, let him look at the basement steps on his left and he may still see a narrow iron ramp down which the doctors could guide their bicycles

Speaking of the future the Bulletin reads

"Today much is needed in addition to the great amount we have, thanks to our fathers in medicine. In planning as fathers to the future of medicine, we have a big responsibility and a wonderful opportunity for service

"Shall the flying machine be figured upon in thinking about the new building, or the small, easily parked automobile? Perhaps even the motorcycle needs to be considered Transportation vehicle storage, or parking is a part of the building problem"

THREE GENERATIONS OF PHYSICIANS

The following letter was received from Dr Thomas B Spence, of Brooklyn, N Y

"In some of your recent issues physicians have reported three or more generations of medical practitioners in families of this State. I belong to the third generation of such a family

"My grandfather, Henry Spence, was born in Seneca County, N Y, in 1800 and practiced medicine from 1823 until the time of his death in 1866 at Starkey, N Y He took a course at the New York Hospital in 1822-23 and a certificate of that date bears the signatures of a number of New York's famous physicians of the time

"My father, Byron Spence, was born at Star-

key, N Y, in 1825 He took the degree of M D at New York University in 1850. For a time he practiced in conjunction with his father but soon devoted himself to farming and fruit culture, and was a pioneer in grape raising on the shores of Seneca Lake. He died in 1884.

"My brother, Henry Spence, was born in Starkey, in 1865 and graduated at Columbia, P & S in 1892 and since then has belonged to the medical profession of Jersey City, N J

"I was born in Starkey, in 1867 and graduated at Columbia, P & S in 1893 My professional life has been spent in Brooklyn"

MEDICAL WARES

DEPTH OF FOCUS OF A LENS

The Medical Wares department of the Jour-NALS of September 15 and October 1, discussed cameras such as physicians would use on a pleasure trip

The greatest speed of a lens that is practical at present is F 18. It is doubtful that this speed can be exceeded for ordinary cameras owing to the limitations of what is called "the depth of focus," meaning the ability of a lens to form a clear picture of objects situated at varying distances from the lens

The invariable rule of the speed of a lens is that the larger the diameter of the lens, the less is its depth of focus. This means that, when a lens with a speed of F 18 is focused on a distant object, those near by will not be in focus. When one person of an irregular group is in focus, the other will be out of focus. This fact will apply to any lens no matter what its grade may be

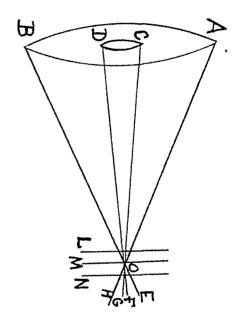

The reason for the slight depth of focus of a lens having a large opening may be shown by reference to the diagram, in which the principle of action of a lens is shown somewhat exaggerated A B represents a lens with a large opening, which in this case is F 13, or impossibly large

When an object is photographed, its light falls on all parts of the lens and is brought to a focus at O. The light which passes through the lens forms a cone whose apex is at O, and whose base is A B.

M represents the surface of a photographic plate. The ordinary method of focusing a lens consists in moving the plate nearer to, or farther from the lens. Suppose a camera is focused on the nearest person of a group, and the position of the sensitive plate is at M. Suppose next he focuses upon a person on the far side of the group, and that the plate is then in the position L. The cone of light from the first person will then be cut-at some distance from the apex and will form a blurred image of the first person.

How can this blurred image be remedied? There is only one way, and that is by cutting down the diameter of the lens Suppose the diaphragm is partly closed so that the diameter of the part of the lens that is used is reduced to CD, or about F 55 in the illustration. The cone of light will then be indicated by the triangle COD, the part cut off by the plate L will be small, and the image of the first man will be much clearer, although it will still be blurred. This means that the depth of focus of the lens will be increased.

How much must a diaphragm be reduced in order to take a clear picture of every person in a group? If the lens in the diagram were drawn to indicate an opening of F 16, the apex of the triangle at O would be so sharp that it could scarcely be drawn with an ordinary pen. There-

fore the pictures of all the men in the group would be as clear as if they were drawn with a fairly sharp lead pencil

The exact amount of blurring, or diffusion, of a photographic image may be shown mathematically with great exactness by the use of the fundamental formula of the action of a lens, as all physicians have been taught in their physics course but have probably forgotten

Let D represent the distance of an object from a lens

Let B represent the distance of the lens from the photographic plate when the image of the object is focussed accurately on the plate.

Let F represent the focal length of the lens, or the distance at which parallel rays of light are brought to a focus

The formula for focusing a lens is then as follows

$$\frac{1}{D} + \frac{1}{B} = \frac{1}{F}$$

This formula will enable a physician to estimate nearly everything he may wish to know about focusing a camera

THE DAILY PRESS

CURE OF LEPROSY

The following news item from the New York Herald-Tribune of November 19 will tend to reassure the people regarding the curability of leprosy—once the most dreaded of communicable diseases

"John Early, famous militant leper, is a leper no more He has been cured—another tri-

umph in modern medicine

"The United States Public Health Service anounces to-day that Early, whose meanderings, escapades and general aversion to leper isolation have in past years sent chills up and down the spines of tens of thousands of healthy Americans in many localities, is to leave the National Leper Home at Carville, La, this month a well man

"Early's 'cure' is due to injections of chaulmoogra oil These injections until recently were extremely painful, but by a method of mixing an anesthetic with the oil this difficulty was removed. Since 1921 only one discharged leper has suffered a recurrence of the disease

"Within a few days Early is to be the object of a ceremony held by the Carville patients when a subject is pronounced 'clean'—born again Remembering the days when burial service was read in English churches over a leper departing, legally dead, to hopeless segregation, his wife to remarry and his property to be divided, the Carville patients rejoice when escorting a recovered patient to the gate to go forth in the world. In accordance with the new custom, Early is to be decked with flowers and sent forth with the blessings of his former associates.

"During the last sixteen months, it was announced, twenty-four patients have been discharged as recovered or the disease 'arrested'"

WITCHCRAFT IN 1928

Why does anybody believe in witchcraft in these enlightened days? Is it because we all have a streak of superstition in our make-up? It would seem that inherited temperament has a part in perpetuating the belief, for it flourishes in certain sections of the country among people noted for their conservatism and adherence to the customs and beliefs which sophisticated New Yorkers consider antiquated and queer

The New York Times of December 5 describes the tragic results of the persistence of a belief in witchcraft in the vicinity of York, Pennsyl-

vania, as follows

"Dr C D Coch, Deputy Superintendent of the Department of Public Instruction, promised today that immediate steps would be taken to adopt a program for stamping out witchcraft, voodooism and other forms of the black arts as practiced in this part of Pennsylvania

"At the same time an appeal was issued by District Attorney Amos Hermann for citizens to report to him immediately all cases in which they know that "pow wow" doctors have accepted fees He promised that immediate criminal proceedings would be started against any person so accused

"Following closely on the announcement by Dr

L U Zech, County Coroner, that at least five infants who had been treated by "pow wow" doctors and had received no medical attention had died here in the last two years. The latest victim was revealed as Raymond P Searchrist, 7-weeksold and the son of Mr and Mrs. Percy Searchrist of this city. Neighbors today recalled accusations made just before the infant's death, about a year ago, that it was bewitched. A local woman "pow wower" was employed to "take off the hex." The infant died about an hour after a physician was called

This Journal of August 1925 contains an editorial on quacks founded on the observation of the unimpeded sale of quack kidney medicine every night in the center square of a small city near York. It quoted a preacher in the city who said "We have fine doctors here who have great skill, and we do as they tell us, and the city is healthy. But what this man says may be true, and therefore we buy his medicine, and can you prove to me that what he says is false? We are a people full of faith and we trust both the doctors and the peddlers of medicine."

Does not this quotation shed some light on the persistence of the belief in witchcraft in that locality?

THE ARISTOCRACY OF THE PHYSICIAN

The New York Times of December 7, includes physicians in its discussion of the standing of

various groups of citizens in the eyes of society when he says

"A scientist, perhaps with an engineering background, announced two days ago that mechanics are the most intellingent class, with engineers and technical men second, business men third and doctors, ministers and professors just above the lowest moron group

"In ancient Europe, for example, soldiers and robber-barons ranked highest, with bankers, astrologists just above the serfs and slaves. In medieval Europe, churchmen were all-powerful Such few 'scientists' as existed were looked upon

with distrust

"It may be alleged that there is no real con-

nection between intelligence and caste But it is doubtful if this will diminish the high opinion which various groups have of their own standing or eliminate the comfortable sense of superiority over others which this gives them Incidently, several engineers have already protested that they stand far above the mechanics, as witness the fact that one of their number was recently elected to an important office in this country."

No matter what opinion the people may have of the physician during their hours of comfort, there is no doubt of their dependence on the doctor in the presence of pain or an accident

A POEM

The following verses from the "More Truth than Poetry" column of the New York Herald Tribune of November 24, may have an appeal to the two classes of persons who seek to escape

from the rigors of winter, the one by migrating to the South Land, and the other by hibernating in cavernous hotels in the cities and pleasure resorts of the North

BEARS

When winter's breath has chilled the air, When ice and snow are everywhere

And there is nothing to be done Which can be classed as fun,

The prudent and sagacious bears Embed themselves in sheltered lairs

And there discreetly hibernate Until the frost and cold abate

They may lose some three months a year From their sojourn upon this sphere,

But in their active waking hours Their time is spent in blossoming bowers Where meat and drink are close at hand Throughout the warm and sunny land

Far better hide in caverns deep And spend three months in healthful sleep

Than battle with the elements When snows are deep and cold's intense

Far better cuddle, snug and warm, Through days of snow and cold and storm

Than eke a scant existence out When gloom is heavy round about

And yet man thinks he has a lot Of common sense, while bears have not

GOVERNOR-ELECT ROOSEVELT ON HEALTH

Physicians will be interested in the newspaper reports of a simple Sunday evening address given by Governor-elect Franklin D Roosevelt, at the sanatorium which he founded at Warm Spring, Georgia, for those having had poliomyelitis, as he has The New York Sun of November 26, quotes Mr Roosevelt as saying

"It is important that nobody be physically handicapped, and the day is coming within forty or fifty years when America will realize that it is the mescapable duty of the Government to educate the body as well as to educate the mind, to teach the people that care of the body goes hand in hand with care of the mind

"As our national wealth increases it will be increasingly important that every child be

equipped with a sound body and a sound mind, and as our world becomes more complex we, the State, will insist that every youngster be given these advantages and thus we will come neare, to the golden rule, because we will be doing for the race collectively what individuals have been unable to do for the last 2,000 years

"We will be bringing a new and better Christianity to the world by carrying out the simple second commandment to love our neighbors as ourselves, and along with a better Christianity

we will build a better civilization"

A governor who advocates the community solution of community health problems, and lives his creed in his business life, will uphold the high ideals of the medical profession when he enters upon his duties as Governor and law maker

BOOK REVIEWS

Modern Medicine. Its Theory and Practice in Original Contributions by American and Foreign Authors Edited by Sir William Osler, Bart, MD Third edition, thoroughly revised. Re-edited by Thomas McCrae, MD Assisted by Elmer H Funk, MD Volume 6 Diseases of the Nervous System—Diseases and Abnormalities of the Mind. Octovo of 964 pages, illustrated Philadelphia, Lea and Febiger, 1928

This is an admirable and up-to-date work devoted largely to the typical organic diseases of the nervous system Of the twenty contributors (at least two of whom have since died) fifteen are Americans, one a Canadian and four Englishmen, all well selected for their parts. The sixty-five illustrations and three colored plates are mostly original, and in a book for general use might well be more numerous. Otherwise little dis-tinctly new can find a place in such a treatise. Many items here and there naturally admit of discussion

Neurasthenia is retained, though Burr (p 627) very wisely interjects that, "Most neurasthenics, then, show something wrong in the family history"

Apparently ankle-clonus finds no mention in the reflexes and their anomalies (p. 76-78), though of course

closely related to the Achilles jerk.

'In the majority of cases the diagnosis has to remain very uncertain" as between cerebral arterial rupture thrombosis and embolism. This differentiation is most important for therapeutic success, and is quite possible in a considerable majority of cases, if we have all the As the book is for general use, and the family physician is familiar with the patient's history and likely to see the case promptly he should be specially acquainted with the differential points

Gelsemium is recommended in facial neuralgia holds for high-pressure patients, but strychnine is best for the opposite back-ground Neurologists however do

not seem to dote much on therapy!

Epidemic encephalitis includes lethargica, yet the lat-

ter term is not included in the Index.

Part II, p 883-926, devoted to Diseases and Abnormalities of the Mind, gives a very available general outline, malarial treatment of paresis being noted elsewhere Septic, as distinct from mere toxic, psychoses might well have a word for this group of readers

It speaks well for our public that a work of this quality can go to a third edition. As a whole it constitutes

an excellent standard text for general reference.

WILLIAM BROWNING

DISEASES OF THE GALL BLADDER AND BILE DUCTS Book for Practitioners and Students By EVARTS AM-BROSE GRAHAM, A.B., M.D., and others Octavo of 477 pages, illustrated. Philadelphia, Lea and Febiger, 1928 Cloth, \$8 00

The authors call attention to the fact that no comprehensive discussion of gall bladder diseases has appeared in the English language since Rolleston's classical work "Diseases of the Liver, Gall Bladder and Bile Ducts," published in 1905 They have endeavored in the present work to cover the subject in a systematic manner with special emphasis on the newly discovered knowledge of the gall bladder Since much of this matter is controversial they have quoted extensively from articles and have assembled as much of the newer literature on the subject as possible so that the book may serve as a convenient guide to what has been done on the gall bladder and bile ducts in recent years. Much of this recent work has concerned itself with the physiology of the gall bladder and the newer methods of diagnosis. Cholecystography has been discussed extensively Their individual and pioneer work in this regard makes their opinion as to the diagnostic accuracy as well as the short-comings of Cholecystography of considerable

An extensive review of the various tests of liver function in relation to the diagnosis of gall bladder disease This will be much welcomed by the many is included who have struggled through the literature on this sub-

An important feature of the book is the emphasis which appears in many places throughout calling attention to the importance of considering disturbances in the liver and other organs as a part of the picture of gall bladder disease

The medical aspect of gall bladder disease is only briefly discussed as the Authors consider non-surgical methods of treatment mefficient except as they are used symptomatically and as a means of preparing patients for operation

The chapter on surgical treatment with its history of operative attempts upon the gall bladder and ducts, its description of the operative procedures and the final results of operation is both interesting and instructive

The book throughout shows a very painstaking at-tempt to collaborate the literature and bring the subject up to date.

The illustrations are adequate and instructive

RUSSELL S FOWLER.

THE TREATMENT OF DIABETES MELLITUS By ELLIOTT P JOSLIN, M.D Fourth Edition Octavo of 998 pages, illustrated Philadelphia, Lea and Febiger, 1928 Cloth, \$900

It is fortunate for doctors and their diabetic patients that Doctor Joslin maintains from year to year, and he has spent twenty-nine of them now in his study, the same eager, enthusiastic, and searching interest in Diabetes Mellitus For he is primarily a clinician, and however greedily he reaches out into every corner for every scrap of experimental work that has to do with his subject, he tries it all in the fires of his own experience with diabetic patients, before he accepts or detracts. And what greater contribution can be made than a clinical report of roughly six thousand cases, critically studied and interpreted in the light of all the available experimental evidence.

This is the fourth edition of Treatment of Diabetes Mellitus, and just as they in turn towered above like books of their day, so does this fourth edition surpass them and probably any other single book on this subject in the English or any other language. It is a giant in size, running to nearly a thousand pages with the index, as compared to its ancestors, and this enlargement is due to the tremendous amount of work which has gone forward since insulin came, in both the laboratory and the clinic. Moreover, he apparently has not missed a trick. He begins with the story of msulin and the lives of the departreatinized dogs which have lived for long periods by its use. He indicates their importance to clinicians, passes on to Diabetes Mellitus in human subjects and takes up in turn, the etiology, physiology and pathology, which includes total metabolic studies, diagnosis, diet, treatment, complications, particularly accidence and compared course course chapters to diagnosis. doss and coma, and gives special chapters to diabetes and surgery, in childhood, in pregnancy, its relation to the other glands of internal secretion. There is also given the charts of food values and food requirements, and a few rules for executing diabetic foods. This many and a few rules for preparing diabetic foods. This matter has less attention in this edition than in the previous

ones, and the really important material has been kept.

This fourth edition of Treatment of Diabetes Mellitus is of monumental proportions, and is probably the most important single volume which will be offered to the medical profession this year. This, because of its common appeal, is such a happy combination of science and clinical experience which in turn is true because its author is able always to approach the matter with the same zest and willingness to record all and give his thoughts as he goes along He is a man of attainment, and conviction, a clinician of the first order, and he spares no effort to present diabetes in its new phase, wisely and completely. There may follow later editions of the same book, but it is safe to predict that none will be more timely or epoch making L C. Johnson

THE SURGICAL TREATMENT OF MALIGNANT DISEASE.
By SIR HOLBURT J WARING, M.S., M.B. Large octavo of 667 pages, illustrated. London and New York, Oxford University Press, 1928 Cloth, \$1500 (Oxford Medical Publications)

This excellent compendium of the present British opinion on the surgical treatment of malignant disease, deserves high praise. It is naturally very British and is a rather striking example of the merits and of the faults of medical literature in England. It is practical and full of good sense and does not attempt to say all that has been or could be said on any of the subjects it touches There are subjects however in which its finalism is a bar to future progress It is well named The Surgical Treatment of Malignant Disease but would be more exactly called the Treatment of Malignant Disease by Operation for which radiological methods are mentioned occasionally They are passed over with respected confessions of ignorance and inexperience.

The first chapter is the Bradshaw lecture and is devoted to a consideration of cancer in general with a sufficiently simple classification for the simple principles of

surgery which the book advocates

The book approaches the subject from the clinical side and each of the subsequent chapters deals with regional malignancy, symptoms, clinical appearances, the surgical treatment. A brief bibliography follows each chapter which may, in most instances, serve as a syllabus or

an introduction to a study of the subject

The volume is a capital introduction to the operative side of the therapy of cancer

MANUAL OF SURGERY (Rose and Carless) For Students and Practitioners By Albert Carless, C.B.E., M.B. and Cecil P.G. Wareley, F.R.C.S. Twelfth Edition Octave of 1844. Octavo of 1544 pages, illustrated New York, William Wood and Company, 1927 Cloth, \$11 00

In some 1,500 pages of closely printed material one finds, in this Manual of Surgery, the 12th Edition and Revision, practically every subject upon surgery that is usually materials existents. usually included in the large six or eight volume systems

This is primarily a work for students, or for research and ready reference for practicing surgeons, and is indeed comprehensive in scope, covering etiology, pathological anatomy, operative and non-operative treatment and technique in generous detail Scattered throughout the pages are numerous and adequate illustrations

In completeness and compactness this work will be hard to duplicate, which fact accounts for the appearance of this twelfth edition. The first edition appeared in 1995 in 1895, and other editions have been published in Hungartan and Chinese.

R DURHAM

OPERATIVE SURGERY PERATIVE SURGERY By J SHELTON HORSLEY, M.D. Third Edition. Octavo of 893 pages, with 756 illustrations St. Louis, The C V Mosby Company, 1928 Cloth, \$15 00

This third edition is an enlargement on the personal experiences of a master surgeon One is impressed with

the careful, concise detailed description of all operative procedures All necessary details are given Superfluous details are omitted. The illustrations are many, showing the real difficulties encountered and the proper technic to overcome them

It is a record of operative procedure which adequately meets the exacting needs of the surgeon. Whether you wish to perform a gastro-enterostomy or to disconnect one already done, whether a resection of stomach or bowel, accurate succinct methods are presented. Much new experimental work on blood vessels and peptic ulcers is included Emphasis is laid on interpretations of biologic processes met with and following operations and necessary physiologic knowledge of the parts operated is always given

To review this work is to add it to one's library

JLB

THE DETERMINATION OF HYDROGEN IONS An Elementary Treatise on Electrode Indicator and Supplementary Methods with an Indexed Biblography on Applications By W MANSFIELD CLARK, M.A., Ph.D. Third Edition Octavo of 717 pages Baltimore, The Williams & Wilkins Company, 1928 Cloth, \$650

The third edition of this important monograph is not merely a new edition, it is really a new book. No one actively interested in the subject of hydrogen ions can afford to be without a copy of this invaluable book, not even if he possesses a copy of the second edition

Clark dedicated this work "To Fellow Workers in the Biological Sciences, Architects of Progress, Who Hew the Stone to Build where Unseen Spires Shall Stand* His fellow workers in turn acknowledge the debt they one him for his admirable summary of the present status of the subject. As he points out in the preface about 100 papers dealing with hydrogen ions were published annually from 1911 to 1918, since then the number has increased enormously until there were more than 1,400 such papers published in 1927 alone. In addition to numerous applications there have been important new developments of various aspects of the subject.

Among these latter topics treated by Clark may be mentioned the quinhydrone electrodes, electrometric titrations, and a chapter on the Debye-Hückel theory of electrolytes The discussions of indicators and buffer solutions are the finest extant. In short, Clark's monograph is the standard work on the subject

Clark is evidently of the opinion that technical accuracy and literary excellence are not necessarily incompatible, and that grammatical correctness is not enough The quotations at the head of the chapters, the poetry included in the discussion of equilibrium and the interestingly written discussions all give a distinctly literary flavor to the book.

M J SHEAR.

Nerve Tracts of the Brain and Cord Anatomy—Physiology—Applied Neurology By William Keiller, F.R.C.S., Ed. Large octavo of 456 pages, illustrated New York, The Macmillan Company, 1927 Cloth, \$8 00

When students take up the subject of nervous diseases it is desirable that they should be able to think in terms of matomy, physiology and pathology. The aim of this work is to make it possible for them to do so, and in our judgment it should be a great aid to the student body Incidentally, it should be said that general practitioners would also be aided by this book in mastering the fundamental "mechanics" of the commoner nervous diseases Essentials rather than details are presented. The book is a valuable addition to the literature.

A. C. J

OUR NEIGHBORS

NEWS FROM COUNTY SOCIETIES IN TEXAS

The attitude of the Texas State Journal of Medicine toward news from the county societies is the same as that of the New York State Journal of Medicine and is well set forth in the following editorial from the November issue of the Texas Journal—Editor's note

We very much desire the fullest sort of reports from those societies which actually deal with subjects that are, or should be, of interest to our readers, and we do not get enough of these, as for that, but we are equally as emphatic in our request for as full reports from the smaller societies, whether or not their members think they have among their number worth while producers of medical literature and scientific thought. One of our purposes in printing this material is to present to the student of our times who may come after us, a cross section of the medical profession of our day and time. There is no better way of accomplishing this

purpose than to make a record of what we are talking about, somewhere, and there is no better place for that than in the "Society News" columns of the JOURNAL

Some are disturbed over the thought of preparing items of this sort which would be of-possible interest to our readers. The Trustees have hired two editors who are deemed competent to edit material of this sort, and no one need be afraid of them. The big idea is to get into the report what actually happened, and as nearly as possible what was said, and the editor will do the rest. We can delete and cut out, but we cannot insert and build up

If any member of any county society thinks his society should be represented in the Society News columns of the JOURNAL, let him take the matter up with the society and see if some one may not be induced to prepare the reports and send them in We will certainly be pleased to have them

THE NEBRASKA COMPENSATION LAW

The physicians of Nebraska are having trouble with their fees in compensation, just as the experience of New York doctors has been. The Nebraska State Medical Journal for December makes the following editorial comment on the administration of the law—Editor's note

From the viewpoint of the medical profession the present Nebraska Compensation Law is fairly satisfactory. The majority of the benefits arising to the workmen will be settled by the Labor Commissioner in a satisfactory manner Few cases will go by appeal to the district courts

Three parties are mainly involved. The employee, the employer, and the physician who cares for the employee The insurance companies settle the payment of the costs and the manufacturers in turn pay for the insurance. In between falls the medical profession. The only objection, at this time, is from the Manufacturers Association, which claims that the costs are excessive and must be reduced or the law will fail It also states that Iowa has a cheaper rate and its law works perfectly We have studied the costs in other states and find it hard to agree that the costs in Nebraska are excessive, at least the costs for medical and hospital benefits. Be that as it may, the manufacturers have been before the commission, appointed by Governor McMullen, and are asking for that body to sustain them in their demand for a revision of the laws during the next session of the legislature, placing a lower

limit on the fees to be charged by the hospitals and physicians. Thus the medical profession is caught between the upper and nether millstones of the insurance companies and the manufacturers.

It has been almost offensively presented, by the Commission to Survey Nebraska Compensation Laws and the Labor Commissioner and Manufacturers Association, that the medical profession has grafted and thus caused embarrassment in the settlement of cases and in the administration of the law The answer has been that some physicians may have presented exorbitant bills, but that the rank and file of the profession are honest and will show as clean a crosssection as any of the parties involved. It is also maintained that the real burden of the law falls on the medical profession and that it must receive adequate compensation It must have an unprejudiced hearing in the courts set up if the best men in the profession are to give their services and the employees to receive average compensa-It has not been a pleasant task to go before these various individuals representing the great bodies involved There is a certain amount of class feeling against the medical profession. largely reflecting a narrow viewpoint, that is so often experienced by a clean, progressive physician employed in the public welfare. However. the Nebraska State Federation of Labor has de-

OCULISTS:

with your own glasses, would notice increased clarity with Tillyer lenses, we'd hardly venture to ask that you try them. Will you, yourself, wear a pair? Our research laboratories vouch for the new computations that make them more accurate and our 150 prescription shops are equipped with new Tillyer machinery so that you can have Tillyer lenses on Rx, anywhere in the United States. First of all, they interpret your prescription as accurately in the margins as the center, and second, they are polished in the same way that fine camera and telescopic lenses are polished.

id that the employees shall have first-class and that they shall be cared for in keepth the dignity of an honest wage earner, an object of charity, and that the medical Il be commensurate with the services Thus dical profession is not without a friend in and the alignment of forces brought to o amend the law may, after all, be favorable welfare

medical profession will be well cared for present law is unchanged, if no limit is on the medical fee, and if the Commisas at present adjudicates the settlement of with the right of appeal left to the doctor hay be dissatisfied with the settlement. This il may be taken when there has been an unhable allowance made for his services. The sal for a change is made to provide for a pission to serve without pay, consisting of One member to be appointed by the goveron nomination by the Nebraska State Medissociation, and likewise (2) one from the aska State Federation of Labor, and (3) rom the Nebraska Manufacturers Associa-An unreasonable allowance for medical all be the only basis of appeal, and from ommission appointed the physician shall a right to go to the district court if he so

hile this matter is of great importance to edical profession, in a monetary way, and effort to maintain its right before the law, after all, the biggest task this winter, before legislature, is to maintain our present Mediractice Act, including the Basic Science Law

YSICIANS AND PUBLIC HEALTH IN HOLLAND, MICHIGAN

he seventeen physicians of Holland, Michi-, a city of 12,000 population, have united in ogram to carry on public health work in their munity How they did it and what they aciplished is told in the following item in the ember Journal of the Michigan State Medi-Society -Editor's note

he attention of physicians and health officers several parts of the state has been drawn to effective health program carried out by Dr mel G Cook, the health officer of Holland conceived the duties of the office to be largeat of formulating and getting into practice, ound, well worked out public health proced-

He sees in the physicians of his city the best ssible means of giving to the people the best it is available in preventive medicine ysicians of Holland act as the clinical arm of local health department and carry out all the mical work undertaken by the department (Continued on page 1514 adv xiv)

KNICKERBOCKER **ADJUSTMENT** SERVICE CO.

Incorporated under the laws of the State of New York

152 West 42nd Street, New York City

Today is a credit age and physicians cannot avoid credit losses unless they avail themselves of the service of a reliable Credit Rating and Adjustment Company Such a service is worth many thousands of dollars to physicians in any community

The Knickerbocker Adjustment Service Co., is making a supreme effort to render a better credit rating and adjustment service than was ever dreamed possible heretofore.

A FINANCIALLY RESPONSIBLE INSTITUTION

Infra-Red Generator with an

Ultra-Violet Carbon Arc Lamp

A complete, illustrated booklet will be mailed on receipt of request See this booklet before buying

Geo. Tiemann & Co. 107 East 28th Street New York

Our General Catalogue sent prepaid on request

More Convenient— More Economical— Greater Therapeutic Range

DISTINCTIVE features make the new Battle Creek Super Solar Arc Lamp noteworthy for its safety, efficiency, economy and broad therapeutic range. The automatic magnetic feeding of the carbons insures the largest arc possible with the given current. The current is perfectly utilized, and the use of 12-inch carbons minimizes loss of time and delay

Ease of adjustment to any desired position and the means of locking the lamp in place make this appliance most satisfactory for general use Power is variable in the Super Solar Arc. The rays may be concentrated to produce caustic effects, or toned down to reproduce mild sunlight. The combination of ultra-violet, infra-red and other light rays produces a spectrum that most nearly approaches that of natural sunlight

Solar erythema can be produced with the Battle Creek Super Solar Arc in six to eight minutes, when desirable Occupying a minimum of space, due to its upright position, the lamp may be easily and quickly moved in adjustment to the patient

The new Super Solar Arc Lamp employs many advanced features in construction. May we send you our new bulletin, completely describing this efficient appliance?

Sanitarium & Hospital Equipment Co Battle Creek Michigan

Battle Creek Therapeutic Appliances

ınclude:

The Battle Creek Mechanical Health Horse

A valuable aid in the treatment of chronic conditions Provides exercise identical with horse back riding, so frequently prescribed by physiciansforhealth promotion.

The Battle Creek Massage Table-

A portable electric lightbath of great con venience to the general practitioner as it may be transported to any, home where the ner essary electrical con nections may be easily made.

The Battle Creek Solarc Bath—

Type BB
A very efficient appara
for general body
radiations of light, heat
and ultra violet. Addi
tronal units may be
added so that one lamp
will radiate the adjacent sides of two tables

EDITORIALS ON MEDICAL NEWS

Menal in the December Journal of the State Medical Association makes the total suggestion regarding commens them in new spapers—Editors 1 of

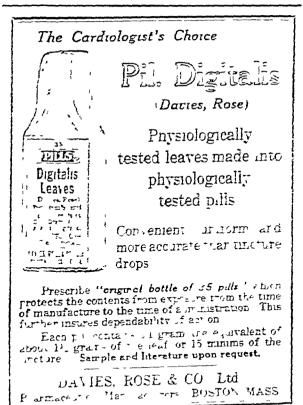

al lads come under the head of news with must be reported to the public. The minimizing public, ever ready to se zero with suggestions, is particularly impressed ow in medicine. The truth or falsity of its rarely considered by these and one-content that it wear the shining croin with Their swallow and assimilate in the particular suggestion at the There is never the slightest suggestion bear typiagia.

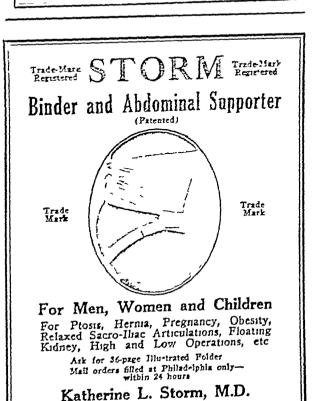

by project these earnest souls from their own their, and to save them from the present of a full ephemeral medical idea e young that the press publish, in addition to the titem, an editorial comment describing the tratus of any medical discovery

simplicity of this is obvious, the value be widespread, and the item would lose of its news value Proper cooperation bemedical societies and the press would re-In the securing by the press of satisfactory adequate information Reliable sources d be used by those in charge of nev spapers e end that the truth of modern medical tht might be disseminated instead of a garreport, or only the half truth, which may acalculable harm Editorial comment would become a force for good in the community the much-harassed physicians perhaps saved other purposes than to answer questions enered by incomplete and at times totally clous news reports

start in this direction has been made by of the newspapers in St. Louis which have cooperating with the medical society to pubreliable editorial comments. We have not that this is also being done in other comties, however, we feel that it should become eral and it is with the hope that we can stimtle interest in this subject among the news-

on it at this time

CONSTIPATION

In the Breast-Fed Infant

HORLICK'S MALTED MILK has long been used with success in the prevention and correcof constipation among breast-fed infants

For the Nursing Mother-

Many doctors advise the nursing mother to drink regularly each day three glasses of Horlick's—the Original—Malted Milk, knowing that she will add to her own store of energy, increase the flow of her breast milk and provide her child with the food elements which result in regular bowel movements daily

For the Breast-fed Baby-

Supplementary feedings of "Horlick's" almost invariably bring relief to the child and rest to the mother, even in stubborn cases of constipation.

Clip out this coupon and return for a supply of samples.

(Continued from page 1513-adv xiii)

No clinical work is undertaken by the officer, all of it being done by the physic

active practice in the city

A program of preventive medicine ha worked out by the physicians of Hollar their health officer that has made their city larly free from the acute contagious d In the fall of 1926 a program was work whereby the physicians of Holland imn the entire school population again dipl The health officer carried out the educ work, the propaganda and the organizat The clinical work of admini the work the toxin-antitoxin was all done by the cians practicing in Holland

So successful was this plan of promoting lic health work that the following year th form of organization was used to immun entire school population against scarlet

As a direct result of this work, there I been a case of diphtheria in a school ch the past two years

The amount collected by the physicia their work was slightly more than they have received by taking care of the ten c diphtheria and one death that had been ti vious yearly average Nevertheless, by st this money for prevention, the people have diphtheria ancient history in their city, ar have their children with them instead of to the number of children in the local cei

Although the prevention of scarlet fe active immunization has not had the loi that diphtheria immunization has had, th cess of the diphtheria prevention work them to apply the same principles to th vention of scarlet fever The following similar piece of work was done in the immunization against scarlet fever scarlet fever immunization has been carrie there has not been a case of scarlet fever city of Holland, notwithstanding the fac the township around the city has had So successful were the two previous paigns of disease prevention that it was d to do it again this fall. The same organi was used again The health officer organiz work and informed the public concerning i physicians practicing in the city did all i clinical work

This year toxin-antitoxin and small pox cine was administered to all children who hi tered school since the previous work was

Holland is not the first nor the only c Michigan to carry on work of this kind, is of importance that Holland should be a to the growing list of cities where the 1 officer can combine the forces of his office those of the organized medical profession the benefit of the public to be served

CONSTIPATION

In the Breast-Fed Infant

MALTED MILK HORLICK'S has long been used with success in the prevention and correcconstipation breast-fed infants

For the Nursing Mother—

Many doctors advise the nursing mother to drink regularly each day three glasses of Horlick's—the Original—Malted Milk knowing that she will add to her own store of energy, increase the flow of her breast milk and provide her child with the food elements which result in regular bowel movements daily

For the Breast-fed Baby-

Supplementary feedings of "Horlick's" almost invariably bring relief to the child and rest to the mother, even in stubborn cases of constipation.

CANCER TALKS BY RADIO IN ARKANSAS

The November issue of the Journal of the Arkansas Medical Society, page 125, discusses radio talks on cancer as follows

entertainment by radio fans, is being pressed into

"The radio, while largely used as a means of

service to diffuse propaganda on all manner of live issues. Advertisers use it to cry their wares, in fact, the commercial uses are necessary to keep the many broadcasting stations going Preachers use it to broadcast their services and sermons and thus reach thousands of non-church goers. Politicians use it freely in these pre-election days and the speeches of the candidates and other orators are broadcast directly from the rostrums so that millions of people from coast to coast receive it simultaneously with the hearers actually present at the meetings

"The daily newspaper has been esteemed as the greatest possible medium for the widespread diffusion of news and public opinion. It may truly be said that the radio is a greater and more farreaching medium This is especially true of such propaganda as that concerning cancer For several years campaigns for the eradication, or at least for the lessening of cancer have been waged by the various medical societies through-Before the radio became out the United States in practically universal use, the newspaper was undoubtedly the best medium to distribute information tending to diminish the number of cancer cases by urging prompt examination by physicians of even the slightest indication or possibility of cancer developing. But the majority of newspaper readers read only what is of immediate interest to them

"The motion picture has largely supplanted the stage Why? Because it is less trouble, requires less mental effort, to see a drama or story in pictures, the general idea represented by brief sub-titles and explanations, than to hear all the spoken words. In like manner people

all the spoken words. In like manner people find it easier to listen than to read about any manner of scientific matter. Thus it well may be that millions of people listen in on the radio talks on cancer who never would read the shortest article on the subject in their daily newspaper. Arkansas has not been behind in this cancer pre-

vention propaganda and the talks by leading physicians over the air must have done a world of good among people who would not otherwise have been enlightened on this important subject.

THE WOMAN'S AUXILIARY IN TEXAS

The Texas State Journal of Medicine of November contains the following description of the usefulness of the Woman's Auxiliary in specific instances—Editor's note

(Continued on page 1517-adv vvn)

(Continued from page 1516-adv vvi)

How easy it would have been for the Woman's Auxiliary to have stopped the imposition on the public, perpetrated by the promoters of the lecture tour of the late Coue, had anybody thought about it. We knew the thing was all wet, but we did not think to say anything to the women, and their attention was not called to the matter.

and their attention was not called to the matter Just ever so ofen some big department store, or chain of department stores, promotes a series of pseudo-health lectures, designed to promote the

pseudo-health lectures, designed to promote the sale of some apparatus, food substance, or medicine. How easy it would be for the women to

stop these abuses. We doctors cannot do it, for the reason that we are too busy with other matters. Maybe the women are busy, too, but they do not have so many other thing to do in this field as we think we have to do. In one of our larger cities a member of the local Woman's Auxiliary noticed that a department store was doing the sort of thing just referred to. On her

doing the sort of thing just referred to On her own initiative she called upon the proprietor of the store, explained to him the dangers of the enterprise, and it was stopped, forthwith and immediately Our legislature is going to meet very soon. It would not appear to be good pol-

icy to send our women down to Austin to get in the lobbying game, but there are many ways of killing a cat besides choking it to death with butter. There are two classes of people in this state who have a right to speak about public

health legislation One of them is the physician, who knows certainly what it is all about, and the other is the women, who must care for the children and raise a family and who should know

dren and raise a family, and who should know what it is all about A conference with a committee from the Woman's Auxiliary and a committee from the medical society, with a group of legislators from any particular locality where-

in the problems upon which legislation has to

bear are discussed, can but have good effect, and

much better effect than a conference involving only ourselves

Occasionally we desire to promote some local public health enterprise, such as a health lecture, or a health show. It is a cinch to simply tell the Woman's Auxiliary to go ahead and get it up

They will do it, with our help, of course and,

doubtless, at our expense, but it will be done

Along these and many other lines the units of the Woman's Auxiliary may be made useful, but

Mellin's Food-A Milk Modifier

Methods of introduction of a milk modifier and of disseminating information concerning at application are comparatively insignificant

Composition and uniformity of production are essential—but what a milk modifier will do is of paramount importance, for uppermost in every physician's mind is to use the best means at his command to help his baby patients

Mellin's Food acts upon the curd of milk, making it flaks, soft and easily digested, thus assuring complete protein digestion followed by normal bowel movements (Infants fed on milk modified with Mellin's Food are not troubled with constipation)

Mellin's Food increases carbohydrates in the highly assimilable form of maltose and dextrins

Mellin's Food adds mineral matter derived from wheat and barley and consisting of potassium, calcium, sodium, magnesium, phosphatic salts and iron, all in a form readily utilized for the development of hone structure and for the regulation of various functions of the body

Mellin's Food fulfills every requirement of a milk modifier and its use is consistent with the evidence accumulated since the beginning of the study of the science of infant feeding

(Continued from page 1517—adv xvii)
it is up to us to get in touch with this organiza-

tion, keep in touch with it and keep it in touch with us. It is all right for us to say to the Woman's Auxiliary, "Watch our movements, and do what you can to support us," but no battle was ever won that way. The support of a force in action does not watch the fighting lines and filter in whenever it is necessary, or flank when it seems wise to do so. It takes its position, usually in a sheltered place, and stays there until the

commander orders it up And when it is ordered up it is told where to go, when to get there, and what to do when it gets there. It is not told how to fight. It is supposed to know that The commander has probably given as much thought to the eventual utilization of the reserves as he has to any other part of his battle plans. We fail to

take advantage of our opportunities if we do not do just that in connection with our Woman's

EXCHANGE PROGRAMS FOR COUNTY SOCIETIES

The October issue of the Journal of the Iowa State Medical Society contains the following message from the President of the State Society, Dr T U McManus—Editor's Note

"Many County Medical Societies in Iowa are experiencing difficulty in maintaining interest in their scientific programs. Physicians are hesitant about preparing papers and reading them before their own society."

"Without attempting to discuss any of the problems of the County Society, I would like to propose November as visiting month Let County Number One invite County Number Three to visit County Number One in November and furnish the program County Number Three, in turn, may invite either County Number One, or any other County, to furnish their program For reasons too numerous for discussion, I will sug-

County to put on the program

"To those who are favorable to such an exchange of talent it is my suggestion that you immediately invite some County to furnish your program for the month of November

gest that a County should not invite an adjoining

"The success or failure of such an exchange depends very largely on the efficiency of the County Secretary who receives the invitation asking his County to furnish the program

"I wish to emphasize that the County with a small Society should have no hesitancy in inviting any County, regardless of size, to put on their program. Furthermore, I wish to point out that many of these Counties with a small membership are capable of furnishing high-class programs ac-

ceptable to the largest County Societies'

EDICAL SOCIETY BOY SCOUTS IN COLORADO

December issue of Cole home page 407, containing report of the Comfithe State Medical Solor Scouts—Editor

Committee has kept in the the Scout activities ut the vear

id scouting to be a well, progressive forward t looking to the physical and moral development petween 12 and 18 years

Maine

As a form of public service, scouting offers a man an ideal outlet for all the time and enthusiasm he may have at his disposal, and the results are highly gratifying

Scout officials in the various cities look to the doctor for advice and co-operation in their work of developing character and good citizenship in the boy, and it is the hope of your Committee that this interest may continue, on an ever-increasing basis, from year to year

VITAL STATISTICS IN TEXAS

While Texas does some things well, recording vital statistics is not one of them, according to the following editorial from the November Texas State Journal of Medicine—Editor's note

Recording vital statistics is the very foundation of public health It had its beginning with the medical profession The undertaker shares with the medical profession its ending A medical profession alive to the importance of birth and death reports, will work wonders in a public health way in a remarkably brief period of time Texas, to the deep chagrin of many of its citizens, has never been admitted to the so-called registration area of the federal government That is to say that reports on births and deaths have been so meager as to offer no basis for public health calcula-The medical profession of Texas can correct that, particularly now that the health department has been reorganized and the important bureau of vital statistics placed in the hands of a competent and qualified physician, sufficient authority and with money to do the job and do it We will be more willing to give him our unstinted support when we thoroughly sell the idea to ourselves, or permit those who are better salesmen than we are to do that for us
